

Report No. 472(55/1.0/10)

Differences in Level of Consumption among Socio-Economic Groups 1999-2000

NSS 55th Round
July 1999- June 2000

**National Sample Survey Organisation
Ministry of Statistics and Programme Implementation
Government of India**

PREFACE

The National Sample Survey Organisation (NSSO) has been carrying out all-India household surveys on Consumer Expenditure and Employment & Unemployment with a large sample usually once in every five years. The sixth such survey was conducted in the 55th round (July 1999-June 2000) - which covered Non-agricultural Enterprises in the Informal Sector in addition. The schedule of enquiry on Consumer Expenditure for the survey was, more or less, similar to that adopted in previous quinquennial rounds.

The present report is the tenth in the series of reports through which the results on consumer expenditure survey are being released. This report gives the distribution of rural and urban population over different classes of monthly per capita expenditure, separately for persons belonging to specific household (occupational) types, social groups and size classes of land possessed in different States and Union Territories of India. This report also brings out the variation in the level of consumer expenditure by household occupation type, household social group and size class of land possessed.

This report has four sections and one appendix. Section 1 of the report is introductory while Section 2 presents Sample Design and Estimation Procedure. Section 3 gives Concepts and Definitions. Section 4 discusses Summary of Findings. The detailed tables are provided in the Appendix.

The Field Operations Division (FOD) of the Organisation conducted the fieldwork for the survey. The collected data were processed and tabulated by the Data Processing Division (DPD) of the NSSO. The Survey Design & Research Division (SDRD) of the NSSO developed the survey design and prepared the report.

I am grateful to the Chairman and members of the Governing Council, Heads of various Divisions of the NSSO and their colleagues for the contribution made in preparing the report.

Comments/suggestions from the readers will be most welcome.

New Delhi
September 2001

N. S. Sastry
Director General & Chief Executive Officer
National Sample Survey Organisation

Highlights

- This report brings out the variation in the level and pattern of consumer expenditure of households classified by household occupational type, household social group and size of land possessed, and by State/Union Territory and Sector (rural/urban).
- At the national level, among the rural households, those belonging to occupational types 'others' showed the highest average of monthly per capita expenditure (MPCE) (Rs.652) and agricultural labour, the lowest (Rs.386).
- In the urban areas, average MPCE was the highest (Rs.1031) for the household type 'others' as in the rural areas. The average MPCE was the lowest (Rs.541) for the casual labour households.
- In rural India, 38% of the population was engaged as self-employed in agriculture and 31% as agricultural labourer.
- The labourer households accounted for about 38% of population in rural areas whereas in the urban areas their share was only 14%.
- In rural India, the total of scheduled caste and scheduled tribe populations constituted 31% of total rural population – same as the social group 'others'. OBC accounted for the highest proportion (38%) of rural population.
- In urban India, as a whole, the total of scheduled caste and scheduled tribe populations constituted only 18% of total population, while the social group 'others' constituted 52% of total population.
- In rural India, average MPCE was the highest for the social group 'others' (Rs 577), followed by OBC (Rs 474), SC (Rs 419) and ST (Rs 388). The order was a little different for urban India: 'others' (Rs 1005), then OBC (Rs 735), then ST (Rs 691) and finally SC (Rs 609).
- The percentage of population with land less than 0.01 hectare was less than 1 only in Kerala and Orissa. The same percentages were above 10 in Maharashtra and Gujarat.
- In rural India, the households having 4.01 hectares or more of land had the highest average MPCE (Rs.628) among different size classes of land possessed. On the whole, with the exception of the size class '<0.01 hectare,' average MPCE of the households appeared to increase with the size of holding.
- In rural India, among the household occupational types, agricultural labour households showed lower levels of per capita consumption of important item groups like milk and milk products and meat, egg and fish.
- In **urban** India, among the different household types per capita consumption of many item groups (like cereals, milk and milk products and sugar) was the lowest for casual labour households.
- In **urban** India, per capita consumption expenditure on cereals was the highest for ST households.

Section 1

Introduction

1.1 The fifty-fifth round of NSS was conducted during July 1999 to June 2000 for collecting information on household consumer expenditure, employment-unemployment and informal non-agricultural enterprises (other than those engaged in industrial categories of 'mining & quarrying', electricity, gas and water supply) from nationwide samples of households or enterprises. It was the sixth quinquennial survey on Consumer Expenditure and Employment-Unemployment. (See Note 1 below.) In the central sample, the household consumer expenditure schedule was canvassed in 120309 households located in 6046 villages and 4116 urban blocks. This report is the tenth of the series of reports through which the findings of the 55th round consumer expenditure survey are being released. Through the consumer expenditure schedule, data were collected on quantity and value of household consumption of different goods and services, using different reference periods, viz. "last 7 days", "last 30 days" or "last 365 days" preceding the date of survey. However, this report is based on data relating to the reference period of the last 365 days preceding the date of survey for items of clothing, footwear, education, medical (institutional) and durable goods, and of the last 30 days for all other items of consumption including food items.

1.2 The survey ascertained total household expenditure on domestic

account for each sample household during the last 30 days (or last 365 days) and, apart from this, recorded some household particulars including household size, household social group (SC/ST/OBC/others), the broad occupational type (self-employed in agriculture, regular wage/salary earning etc.) of the household and, for rural households, the area of household land possessed.

1.3 This information was used to generate the distribution of rural and urban population over different classes of monthly per capita expenditure, separately for persons belonging to specific household types, occupational groups, and land possessed size classes, in different States and Union Territories (UTs) of India. These data form the basis of the present report.

1.4 The report thus enables the comparison of per capita consumption (considered not as a one-dimensional average but as a distribution of persons over different expenditure classes) for different sections of population demarcated by differing socio-economic characteristics.

1.5 Data on the same subject was last presented for 1993-94, based on the fifth consumer expenditure survey of the quinquennial series conducted during that period vide NSS report No. 422.

1.6 The Sample Design and Estimation Procedure followed in the NSS 55th round survey is given in Section 2. Section 3 presents important concepts and definitions adopted in the survey and used in this report. The survey findings on consumer expenditure are presented in Section 4. The detailed tables on the consumption expenditure on different groups of items are provided separately for each State, UT and all-India in Appendix.

Notes

1. **The National Sample Survey:** The NSS was set up in 1950, with the idea of having a permanent survey organisation to collect data on various facets of the economy through nationwide sample surveys in order to assist in socio-economic planning and policy-making. The NSS is a continuing survey in the sense that it is carried out in the form of successive "rounds", each round usually of a year's duration, covering several topics of current interest in a specific survey period. At present each NSS round reaches, at the all-India level, about 12,000 to 14,000 villages and blocks in the Central sample (covered by the Central agency NSSO) and an independent sample of about 14,000 to 16,000 villages and blocks in the State sample (covered by the Governments of various States and Union

Territories). The entire area of the country - rural and urban - is covered, with the exception of some interior areas of Nagaland and Andaman & Nicobar Islands, and Ladakh and Kargil districts of Jammu & Kashmir.

2. **Household consumer expenditure survey:** It was originally the practice to collect data on household consumer expenditure in every round of NSS, starting from the very first round (1950-51). From 1972-73, according to a decision of the Governing Council of NSSO, the consumer expenditure survey became a quinquennial feature and was also integrated with the employment and unemployment survey in the sense that a common sample of households was subjected to both the enquiries. However, independent samples of households for these two surveys were canvassed during the 55th round. An annual series of consumer expenditure surveys was again launched from the 42nd round (1986-87) to fill the data gaps which planners and researchers had begun to feel. It is the larger-scale quinquennial surveys, however, which are expected to be more useful for the study of trends in the level of consumer expenditure and of the emergence of new spending patterns. So far, six quinquennial surveys of consumer expenditure have been conducted and these were conducted in the 27th, 32nd, 38th, 43rd, 50th and 55th rounds of NSS. They relate, respectively, to the years 1972-73, 1977-78, 1983, 1987-88, 1993-94 and 1999-2000.

Section 2

Sample design

2.1 Sample Design

2.1.1 **General:** A stratified sampling design was adopted for selection of the sample first-stage units (FSUs). The FSUs were villages (panchayat wards for Kerala) for rural areas and Urban Frame Survey (UFS) blocks for urban areas. The Ultimate stage units (USUs) were households for consumer expenditure schedule. The households were selected by the method of circular systematic sampling from the corresponding frame in the FSU. Large FSUs were subdivided into hamlet-groups (rural)/ sub-blocks (urban) that were grouped into two segments, and USUs were selected independently from each of these segments.

2.1.2 **Sampling frame for first stage units:** List of villages (panchayat wards for Kerala) as per 1991 Census and latest lists of UFS blocks were respectively used for selection of rural and urban sample FSUs. For selection of sample villages from the State of Jammu & Kashmir, list of villages as per 1981 Census was used as the sampling frame. All the uninhabited villages of the country as per 1991 Census, interior villages of Nagaland situated beyond 5 km of a bus route and inaccessible villages of Andaman & Nicobar Islands were left out of the survey coverage of the NSS 55th round.

2.1.3 Stratification

2.1.3.1 **Rural:** Two special strata were formed at the **State/ UT level**, viz.,

Stratum 1: all FSUs with population between 1 to 100, and

Stratum 2: FSUs with population more than 15,000.

[Note: The above two strata were spread across a given State and were not confined to any particular administrative division within the State.]

Above strata of either type are formed if at least 50 such FSU's are there in the respective frames. Otherwise, they are merged with the general strata.

While forming general strata (consisting of FSUs other than those covered under strata 1 & 2), efforts were made to treat each district as a separate stratum. If limitation of sample size didn't allow formation of so many strata, smaller districts within a particular NSS region were merged to form a stratum. Each district with rural population of 2 millions or more as per 1991 Census (1.8 millions or more as per 1981 Census in case of Jammu & Kashmir) was split into a number of strata.

2.1.3.2 **Urban :** Strata were formed within NSS Regions as follows:

Stratum number	Composition of strata by considering population of various towns as per the 1991 Census
1, 3, 5 *	'hospital area' (HA) / 'industrial area' (IA) / 'bazaar area' (BA) blocks taken together of each single city with a population of 10 lakhs or more (there could be a maximum of 3 such cities within an NSS Region)

Stratum number	Composition of strata by considering population of various towns as per the 1991 Census
2, 4, 6 *	Other blocks of each single city with a population of 10 lakhs or more
7	HA or IA or BA blocks of all towns with population between 50,000 and less than 10 lakhs
8	Other blocks of all towns with population between 50,000 and less than 10 lakhs
9	HA or IA or BA blocks of all towns with population less than 50,000
10	Other blocks of all towns with population less than 50,000

* Stratum numbers 3, 4, 5 & 6 remain void if there was only one city in an NSS region with a population of 10 lakhs or more.

If sample size was not adequate for forming so many strata, all blocks of stratum 7 were merged with those of stratum 8 and all blocks of stratum 9 were merged with those of stratum 10.

2.1.4 Sample size : A total number of 10,384 FSUs was selected for survey in the *Central sample* at all-India level (rural & urban combined) in the 55th round. For *State sample*, there was normally an equal matching. Exceptions were only for Nagaland (urban), Delhi, Goa and Maharashtra (urban) where State sample size was higher than Central sample. Sample for the whole round for each State/UT and Sector (i.e. rural/ urban) was allocated equally among the four sub-rounds. Sample FSUs for each sub-round were selected afresh in the form of two independent sub-samples. The details of allocation and survey of FSUs, households and persons are given in Statement 0.

2.1.5 Allocation of first-stage units (FSU's): State/ UT level rural sample size was allocated among the rural strata in proportion to population. State/ UT level urban sample was first allocated among the

three classes of towns (i.e. 10 lakh +, 50000 to less than 10 lakhs and less than 50,000) in proportion to population. Then sample allocation for each of the three classes of towns, within an NSS region, was further allocated between two strata types consisting of - (i) HA/ IA/ BA blocks, and (ii) the rest in proportion to total number of FSUs in the respective frames with double weightage given to the first category of blocks. Stratum level allocations for both rural and urban areas of a sub-round were made in even numbers in order to facilitate selection of FSUs in the form of two independent sub-samples. Sub-sample numbers were 1 & 2 for sub-round 1; 3 & 4 for sub-round 2; 5 & 6 for sub-round 3 and 7 & 8 for sub-round 4.

2.1.6 Selection of first-stage units: For each sub-round, sample FSUs from each stratum were selected in the form of 2 independent sub-samples by following circular systematic sampling with (a) probability proportional to population for all rural strata other than stratum 1, and (b) equal probability for rural stratum 1 as well as all urban strata. Thus stratum level allocation of FSUs was multiple of 8.

2.1.7 Formation of hamlet-groups in large villages and number of hamlet-groups selected for survey: Depending upon the values of approximate present population (P) and approximate total number of non-agricultural enterprises (E), decision was taken to divide the FSU into a fixed number of hamlet-groups (hg's - the term applicable for rural samples) / sub-blocks (sb's - the term applicable for urban samples) as per the rules given below:

value of P	no. of hg's/ sb's formed in the FSU as per population criterion	value of E	no. of hg's/ sb's formed in the FSU as per enterprise criterion
(1)	(2)	(3)	(4)
less than 1200	1 @	less than 100	1 @
1200 – 1999	5	100 – 249	5
2000 – 2399	6	250 – 299	6
2400 – 2799	7	300 – 349	7
2800 – 3199	8	350 – 399	8
(and so on)		(and so on)	

@ no. of hb's/ sb's = '1' means the whole FSU was considered for listing.

[For rural areas of Himachal Pradesh, Sikkim and Poonch, Rajouri, Udhampur and Doda districts of Jammu & Kashmir, number of hg's formed in the village as per population criterion was : 1 for P < 600, 5 for P = 600 to 999, 6 for P = 1000 to 1199, 7 for P = 1200 to 1399, 8 for P = 1400 to 1599, and so on.]

The number (D) of hamlet-groups (hg)/ sub-blocks (sb) formed in the FSU was the higher of the two values as per population and enterprise criteria. If value of P was less than 1200 (600 for certain hilly areas specified above) as well as value of E was less than 100 for an FSU, hg/ sb formation was not resorted to and the whole FSU was considered for listing. In case hg's/ sb's were formed in the sample FSU, the same was done by more or less equalizing population.

2.1.8 Formation of Segments within FSU:

The hg/ sb having maximum concentration of non-agricultural enterprises was selected with certainty for listing of households/ enterprises. This hg/ sb was referred to as segment 1. From the remaining (D-1) hg's/ sb's of the FSU, 2 more hg's/ sb's were selected circular systematically and these 2 selected hg's/ sb's together was referred to as segment 2 for doing a combined listing of households/ enterprises. Thus listing of households/ enterprises was done only in

segments 1 and 2 of the FSU. The FSU not requiring hg/ sb formation was to be treated as segment 1.

2.1.9 Stratification of households : All the households listed in a segment (both rural & urban) were stratified into two second stage strata, viz. 'affluent households' (forming second stage stratum 1) and the rest (forming second stage stratum 2). In rural sector, a maximum of ten households which were relatively affluent than others and possessed at least certain item(s) like motor car/ jeep, colour TV, telephone, etc. or owns land / livestock in excess of certain limits. In urban sector, the households having MPCE (monthly per capita consumer expenditure) greater than certain limit for a given town/city were treated as 'affluent' households for the present survey and were included in the frame of second stage stratum 1, and rest of the urban households were included in the frame of second stage stratum 2.

2.1.10 Number of households/ enterprises selected for survey: The number of households/ enterprises selected for survey from each FSU in general is given below:

segment	number of households allotted for consumer expenditure schedule in Second Stage Stratum (SSS)		
	1	2	total
(1)	(2)	(3)	(4)
FSU with hg/ sb formation			
1	1	3	4
2	1	7	8
FSU with no hg/ sb formation			
1	2	10	12

2.2 Estimation Procedure:

2.2.1 General procedure of selection of households: Sample households were selected from the respective frames by circular systematic sampling with equal probability. For the purpose of systematic

sampling, households in the frame of second stage stratum 2 were arranged by means of livelihood and land possessed classes for rural samples and by means of livelihood and MPCE classes for urban samples.

2.2.2 Approach: The estimate for a sub-round was obtained by combining the estimates of the corresponding sub-sample replicates. Similarly, an estimate for the Round was obtained by combining the four sub-round-wise estimates.

2.2.3 The following notations are being used in this section:

- a = subscript for the a-th stratum
 - r = subscript for the r-th sub-sample replicate (r = 1,2,...,8)
 - q = subscript for the q-th sub-round (q = 1,2,3 & 4)
 - f = subscript for the f-th sampled village/ block as First Stage Unit (FSU)
 - s = subscript for the s-th segment of sampled village/ block (s = 1 & 2)
 - c = subscript for the c-th 2nd stage stratum of households in the sampled village/ block (c = 1,2)
 - j = subscript for the j-th sampled household
 - p = subscript for pooled estimate
 - z = size used for selection of an FSU from the sampling frame
 - Z = total of sizes in the sampling frame for the stratum
- [Note: For urban sector, z=1 and Z=N which is the total number of UFS blocks (FSU's) in the frame.]
- n = number of sampled FSU surveyed within a stratum and a sub-sample replicate (including zero cases but excluding casualty and not reported cases) and used for tabulation

- L = number of sub-sample replicates surveyed and used for tabulation
- D = number of hamlet-groups/ sub-blocks formed in rural/ urban sampled FSU
- H = total number of households listed in the appropriate frame
- h = number of sampled households surveyed and used for tabulation from the frame
- E = total number of enterprises listed in the appropriate frame
- e = number of sampled enterprises surveyed and used for tabulation from the frame
- y, x = value of characteristic y, x obtained in the sample
- \bar{y}, \bar{x} = estimated value of characteristic y, x obtained from the sample.

2.2.4 ESTIMATES OF AGGREGATE: In

the formulae given in this section, \bar{y} is the estimate of aggregate of any characteristic y for a given stratum (a), and for a particular sub-round (q) and sub-sample replicate (r). These formulae are provided for the general case of FSU's having two segments 1 & 2. For the FSU's requiring no hg/ sb formation, the formula is identical to that given for segment 1 while the contribution from segment 2 is taken as zero for estimating a characteristic of household from a given 2nd stage stratum (c) in the selection frame

Rural :
$$\hat{Y}_c = \frac{Z}{n} \sum_{f=1}^n \frac{1}{z_f} \sum_{s=1}^2 B_{fsc} \sum_{j=1}^{h_{fsc}} y_{fscj} \quad (1)$$

Here $B_{fsc} = \frac{H_{fsc}}{h_{fsc}}$, for segment 1 (s=1) and

$$B_{fsc} = \frac{D_f - 1}{2} \times \frac{H_{fsc}}{h_{fsc}}, \text{ for segment 2 (s =2).}$$

Urban:
$$\hat{Y}_c = \frac{Z}{n} \sum_{f=1}^n \sum_{s=1}^2 B_{fsc} \sum_{j=1}^{h_{fsc}} y_{fscj} \quad \dots(2)$$

Here $B_{fsc} = \frac{H_{fsc}}{h_{fsc}}$, for segment 1 (s=1) and

$B_{fsc} = \frac{D_f - 1}{2} \times \frac{H_{fsc}}{h_{fsc}}$, for segment 2 (s =2).

Note: For tabulating any characteristic from this detailed schedule $\hat{Y} = \sum_c \hat{Y}_c$ is to be used.

2.2.4.1 COMBINED ESTIMATE FROM SUB-SAMPLES:

In the previous section, the estimate of a characteristic \hat{Y} as obtained for a stratum (a), for a particular sub-round (q) and a sub-sample replicate (r), actually represent \hat{Y}_{aqr} . The combined /pooled estimate for a particular stratum and a particular sub-round is computed as the average of sub-sample replicate estimates and is given below:

$$\hat{Y}_{aq} = \frac{1}{L} \sum_{r=1}^L \hat{Y}_{aqr} \quad \dots(3)$$

2.2.4.2 ESTIMATE OF AGGREGATES FOR A SUB-ROUND AT STATE/ UT/ REGION LEVEL:

If \hat{Y}_{qr} be the State/ UT/ Region level aggregate from the r-th sub-sample replicate and q-th sub-round, and \hat{Y}_{qp} , the combined/ pooled estimate of the aggregate based on the whole sample, for a given sub-round q, then

$$\hat{Y}_{qr} = \sum_a \hat{Y}_{aqr} \quad \dots(4)$$

based on sub-sample replicate group r, and

$$\hat{Y}_{qp} = \frac{1}{L} \sum_{r=1}^L \hat{Y}_{qr} \quad \dots(5)$$

based on all sub-sample replicates.

2.2.4.3 ESTIMATES OF AGGREGATE FOR THE ROUND (i.e. all the 4 sub-rounds together) AT STATE/ UT/ REGION LEVEL:

The estimates of aggregates for the whole round are computed as the simple average of the sub-round estimates derived in section 2.2.2, and are given below:

$$\hat{Y}_r = \frac{1}{4} \sum_{q=1}^4 \hat{Y}_{qr}$$

...(6)

based on sub-sample replicate 1 and 2*and

$$\hat{Y}_p = \frac{1}{4} \sum_{q=1}^4 \hat{Y}_{qp} \quad \dots(7)$$

based on whole sample.

**Note:* In the Round, sub-samples 1, 3, 5 & 7 (in sub-rounds 1 to 4) are combined together to form sub-sample replicate 1 (annual) while sub-samples 2, 4, 6 & 8 (in sub-rounds 1 to 4) are combined together to form sub-sample replicate 2 (annual). This was followed in the remaining sections also. Stratum level estimate for the Round is obtained similarly.

2.2.5 ESTIMATES OF RATIO: If \hat{X} & \hat{Y} be the State/ UT/ Region level aggregate estimate corresponding to variables x and y, then the estimate of ratio is given below:

$$\hat{R}_r = \frac{\hat{Y}_r}{\hat{X}_r} \quad \dots(8)$$

based on sub-sample group r, and

$$\hat{R}_p = \frac{\hat{Y}_p}{\hat{X}_p} \quad \dots(9)$$

based on the whole sample.

The formulae for \hat{X} are obtained similarly by replacing \hat{Y} by \hat{X} and y by x in the above formulae Stated in previous sections.

Note: Estimates for the sub-round \hat{R}_{qr} and \hat{R}_{qp} have been obtained by replacing \hat{Y}_r and \hat{Y}_p by \hat{Y}_{qr} and \hat{Y}_{qp} , respectively and \hat{X}_r and \hat{X}_p by \hat{X}_{qr} and \hat{X}_{qp} , respectively.

Statement 0: Number of sample villages/ blocks allotted and surveyed and number of sample households and persons surveyed

State/UT	no. of villages		no. of blocks		no. of households surveyed		no. of persons surveyed

Section 3

Concepts and Definitions

3.1 **Household** : A group of persons normally living together and taking food from a common kitchen constitutes a household. The word "normally" means that temporary visitors are excluded but temporary stay-aways are included. Thus a son or daughter residing in a hostel for studies is excluded from the household of his/her parents, but a resident employee or resident domestic servant or paying guest (but not just a tenant in the house) is included in the employer/host's household. "Living together" is usually given more importance than "sharing food from a common kitchen" in drawing the boundaries of a household in case the two criteria are in conflict; however, in the special case of a person taking food with his family but sleeping elsewhere (say in a shop or a different house) due to space shortage, the household formed by such a person's family members is taken to include the person also. Each inmate of a mess, hotel, boarding and lodging house, hostel, etc. is considered as a single-member household except that a family living in a hotel (say) is considered as one household only; the same applies to residential staff of such establishments.

3.2 **Household consumer expenditure** : The expenditure incurred by a household on domestic consumption during the reference period is the household's consumer expenditure. The household consumer expenditure is the total of the monetary values of consumption of various groups of items namely (i) food, pan (betel leaves), tobacco, intoxicants and fuel & light, (ii) clothing and footwear and (iii) miscellaneous goods and services and durable articles.

3.2.1 For groups (i) and (ii), the total value of consumption is derived by aggregating the

monetary value of goods actually consumed during the reference period. An item of clothing and footwear would be considered to have been consumed if it is brought into maiden or first use during the reference period. The consumption may be out of (a) purchases made during the reference period or earlier; (b) home grown stock; (c) receipt in exchange of goods and services; (d) any other receipt like gift, charity, borrowing and (e) free collection. Home produce is evaluated at the ex farm or ex factory rate. For evaluating the consumption of the items of group (iii) i.e. items categorised as miscellaneous goods and services and durable articles, a different approach is followed. In this case, the expenditure made during the reference period for the purchase of goods and services is considered as consumption.

3.2.2 It is pertinent to mention here that the consumer expenditure of a household on food items relates to the actual consumption by the normal resident members of the household and also by the guests whether during ceremonies or otherwise. To avoid double counting, transfer payments like charity, loan advance, etc. made by the household are not considered as consumption for items of groups (i) and (ii), since transfer receipts of these items have been taken into account. However, the item "cooked meals" is an exception to the rule. Meals prepared in the household kitchen and provided to the employees and/or others would automatically get included in domestic consumption of employer (payer) household. There is a practical difficulty of estimating the quantities and values of individual items used for preparing the meals served to employees or to others. Thus, to avoid double counting, cooked meals received as perquisites from employer household or as gift or charity are

not recorded in the recipient household. As a general principle, cooked meals purchased from the market for consumption of the normal resident members and for guests and employees will also be recorded in the purchaser household.

3.2.3 This procedure of recording cooked meals served to others in the expenditure of the serving households only leads to bias-free estimates of average per capita consumption as well as total consumer expenditure. However, as the proportions of donors and recipients of free cooked meals are likely to vary in opposite directions over the expenditure classes, the nutritional intake derived from the consumer expenditure survey data may present a somewhat distorted picture. These derived nutrition intakes may get inflated for the rich (net donors) and somewhat understated for the poor (net recipients). This point has to be kept firmly in mind while using the NSS consumer expenditure data for any nutritional studies relating to the nutritional status of households.

3.3 **Reference period** : Reference period means the period of time for which data on consumption was collected. The reference period used for the survey was a “moving” one, varying from household to household, although it was a fixed length of period. During the 55th round of NSS, information on consumption of food, pan, tobacco & intoxicants was collected independently for two different reference periods of last 30 days and last 7 days from the same households. For items of clothing, footwear, durable goods, education and medical (institutional) expenses, data were collected for the reference period of “last 365 days” preceding the date of survey. For the remaining items, a reference period of “last 30 days” preceding the date of survey was used. However, the monthly per capita consumption expenditure (MPCE) figures in this report are based on data collected for the “last 365 days” for clothing, footwear, durable goods,

education and medical (institutional) expenses and for the “last 30 days” for the rest of the items.

3.4 **Sector**: This word used for the rural-urban demarcation: rural and urban are the only two sectors as far as this report is concerned.

3.5 **Major states**: This refers to the following states of India: Andhra Pradesh, Assam, Bihar, Gujarat, Haryana, Karnataka, Kerala, Madhya Pradesh, Maharashtra, Orissa, Punjab, Rajasthan, Tamil Nadu, Uttar Pradesh and West Bengal.

3.6 **Value of consumption** : Consumption out of purchase is evaluated at the purchase price. Consumption out of home produce is evaluated at ex farm or ex factory rate. Value of consumption out of gifts, loans, free collection, and goods received in exchange of goods and services imputed at average local retail prices prevailing during the reference period.

3.7 **Household size** : The size of a household is the total number of persons in the household.

3.8 **Monthly per capita expenditure (MPCE)**: For a household, this is household consumer expenditure over a period of 30 days divided by household size. A person's MPCE is understood as that of the household to which he/she belongs.

3.9 **MPCE classes**: The MPCE classes are normally revised during quinquennial surveys of Consumer Expenditure. Usually, 12 MPCE classes are formed from a table giving estimated cumulative percentage frequency distribution of persons by MPCE for each sector separately. The upper limits of these classes correspond broadly to 5%, 10%, 20%, 30%, 40%, 50%, 60%, 70%, 80%, 90%, 95% and 100% - of population. The class limits are given below:

Sl. no.	rural (in Rs)	urban (in Rs)
1	0 – 225	0 - 300
2	225 – 255	300 - 350
3	255 – 300	350 - 425
4	300 – 340	425- 500
5	340 – 380	500 - 575
6	380 – 420	575 - 665
7	420 – 470	665 - 775
8	470 – 525	775- 915
9	525 – 615	915 - 1120
10	615 – 775	1120 - 1500
11	775 – 950	1500 - 1925
12	950+	1925+

The MPCE classes have been assigned to the households on the basis of data with reference period of “365 days” for items of education, institutional medical expenses, clothing, footwear and durable goods and of “last 30 days” for the rest of the items.

Since average household size tends to decrease as MPCE increases, the percentage of households falling in the bottom MPCE classes tends to be smaller than the corresponding percentage of population (5 or 10%), while the percentage of households falling in the higher MPCE classes tends to be larger than 5 or 10%.

3.10 Socio-economic category: Attempts were made in this report to classify households into different socio-economic categories using three distinct characteristics, viz., (i) social group (ii) household type and (iii) size class of land possessed by the household. (This last characteristic was considered only for rural households.) The following are the detailed specifications of the socio-economic categories of households thus formed.

3.11 Household type: Rural households were classified into five types and urban households into four types on the basis of the occupations pursued by the household members. The five types of rural households are *self-employed in non-agriculture*, *agricultural labour*, *other*

labour, *self-employed in agriculture*, and *other households*. The four types of urban household are: *self-employed*, *regular wage / salary earner*, *casual labour*, and *other households*.

The “type” of a household was determined as follows.

Rural

3.11.1 A household was classified as “agricultural labour”, if its income from that source was 50% or more of its total income. The same criterion was followed to classify a household as “self-employed in agriculture”. A household was classified as “self-employed in non-agriculture” if its income from that source was greater than that from rural labour as well as that from all other gainful sources put together. If a household was not one of these three types but its income from total rural labour was greater than that from all self-employment and from other gainful sources, it was classified as “other labour”. The remaining households were classified as “other households”.

Urban

3.11.2 A household was classified as “self-employed”, “regular wage or salary earning”, or “casual labour”, according to the major sources of its income from “gainful employment” during the 365 days preceding the date of survey. A household not having any income from gainful employment was classified under “others”.

3.12 Household group: Four social groups were distinguished - scheduled tribe (ST), scheduled caste (SC), other backward class (OBC) and other households. In case different members of a household belong to different social groups, the group to which the head of the household belongs has been considered as the social group of the household.

3.13 Land possessed: The area of land possessed (in hectares) includes land owned, leased in, and (encroached) land neither owned nor leased in, but excludes land leased out.

3.14 Milk and milk products: This group includes *ghee*, butter, curds, ice cream, etc. Milk-based sweetmeats (*pera*, *rasogolla*, etc.) come under 'beverages, refreshments and processed food' unless they are prepared from milk, sugar, etc., within the household. In the latter case, consumption of milk, sugar, etc., is accounted separately instead of as a single item under 'milk products'.

3.15 Beverages, refreshments, etc. (including processed food): This includes all beverages including tea, coffee, cocoa, cold drinks and various commercially produced beverages, biscuits and confectionery, salted refreshments, sweets, pickles, sauce, jams and jellies, and also cooked meals obtained on payment.

3.16 Clothing: This category includes bedsheets, bedcovers, pillows, curtains, mattresses, blankets, rugs, mats and matting, cotton yarn, wool and knitting wool. It, however, **excludes** tailoring charges, which come under 'miscellaneous goods and services'.

3.17 Durable goods: This term refers to durable goods other than clothing and footwear (which come under semi-durables); items included here are distinguished from miscellaneous goods by having a longer expected lifetime of use (roughly, one year or more). Though life of some petty durables such as pens, torches, spectacles and walking sticks, as well as books, is normally one year or more, they are by convention included among miscellaneous goods and not under durable goods. *Durable goods used for household purposes thus include furniture and fixtures, recreational goods such as*

cameras, TV, cassettes and musical instruments, jewellery and ornaments, clocks and watches, household utensils and appliances for cooking, heating, cooling, and other work such as sewing, vehicles for personal transport, tyres and tubes, fluorescent tubes and lamps, and other electrical and sanitary fittings. Expenditure incurred on repairs and construction of durables used for domestic purpose is included in "expenditure on durable goods".

Section 4

Summary of findings

4.0 The main findings on variation in the level and pattern of consumer expenditure by household occupational type, household social group and size of land possessed have been discussed in this section. This report is based on mainly two types of tables – per 1000 distribution of persons and average monthly per capita expenditure on different broad groups of items. The discussions have been restricted to major States and all-India only. The variation in average MPCEs over a socio-economic category for each major State and all-India has been examined first and then the corresponding distributions of persons and then per 1000 distribution at all-India level by MPCE class have been discussed in this section.

4.1 MPCE and household type: a state-by-state look

Statements 1R and 1U show average MPCE of different household types in major States and all-India. They reveal the following points.

Rural

In the rural areas, the average MPCEs of persons belonging to any household type were significantly different among major States. At the national level, the average for the occupational type 'others' was the highest followed by self-employed in agriculture, self-employed in non-agriculture, other labour and agricultural labour. At the State level also, the average MPCE was the highest for the household type 'others'. However, the average MPCEs of households belonging to household types 'self-employed in

agriculture' and 'self-employed in non-agriculture' did not vary much within many major States as for all-India. However, large differences between these two types are noticed for Punjab and Haryana. Similarly, the average MPCEs did not vary much within many of the major States between other labour and agricultural labour households. Here also, Maharashtra shows a very large gap between the two averages. The average MPCE was the lowest for agricultural labour in most of the major States followed by other labour.

Urban

In the urban areas, average MPCE was the highest for the household type 'others' as in the rural areas. The average MPCE was the lowest for the casual labour households in all the major States. Unlike rural areas, the average MPCE of households belonging to household type 'others' was not the highest for all the major States. For four out of fifteen major States the average was the highest for regular wage/salary earning households.

The variation in average MPCE across household types was much greater in urban areas than in rural areas.

4.2 Distribution of population by household type

Statements 2R and 2U show the percentage distributions of persons by household type in major States and all-India. These statements bring out that as many as 38% of population

was engaged as self-employed in agriculture and 31% as agricultural labourer in rural India. Thus, more than two-thirds of the rural population was engaged in agriculture. The labourer households in rural areas accounted for about 38% of population whereas in the urban areas the corresponding population was only 14%. In urban areas, the occupational types – self-employed and regular wage/salary earners – each accounted for about 39-40% of population. From these statements it is clear that the occupational distributions of population over different types were very different in rural and urban areas. Closer look reveals that in some States these distributions were markedly different from the distribution at the national level.

4.3 Distribution of population by MPCE class:

Statements 3R and 3U show the distribution of persons by MPCE class separately for each household type at all-India level for rural and urban areas, respectively. In rural areas, it shows that the proportions of persons belonging to household type ‘others’ falling in the top MPCE classes were more than the corresponding proportions for all household types. This was also somewhat true for self-employed in agriculture. But the distribution was just the opposite for population belonging to occupational type ‘agricultural labour’. In urban areas, the distribution was tilted towards higher MPCE classes for regular wage/salary earning households. For casual labour households, the distribution was just the opposite, relatively concentrated over lower values of MPCE.

4.4 Average MPCE by social group:

Statement 4 gives average MPCEs of different social groups in each major State and all-India for both rural and urban areas. In rural areas,

average MPCE at the national level was the lowest (Rs 388) for scheduled tribe (ST) population followed by scheduled caste (SC) population (Rs 419), other backward classes (OBC) (Rs 474) and ‘others’ (Rs 577). For urban areas, the ordering among social groups was the same excepting for ST and SC – where the ranking was reversed. However, in the rural areas, there were five States, namely, Andhra Pradesh, Assam, Bihar, Kerala and Uttar Pradesh for which the average MPCE was higher for the ST population compared to that of the SC population. Similarly, there were two States, namely, Assam and West Bengal, for which average MPCE was higher for OBC population compared to the social group ‘others’.

In the urban areas of the major States, the pattern was similar to the national pattern for most of the major States except for West Bengal and Punjab for which the average MPCE of SC population was slightly higher compared to that of ST population.

4.5 Distribution of population by social group:

Statement 5 gives per 1000 distribution of persons by social group in each major State and all-India for both rural and urban areas.

Rural

In rural areas, the ascending order of social groups by percentage of population was ST, SC, others and OBC. The total of scheduled caste and scheduled tribe populations constituted 31% of total rural population – same as the social group ‘others’. In rural areas, OBC constituted the highest segment of the population (38%). Among the major States, the percentages of rural population belonging to ST was less than 2% in Haryana, Kerala, Punjab, Tamil Nadu and Uttar Pradesh whereas the

same was above 27% in Madhya Pradesh and Orissa. The proportion of SC population was relatively low in Assam (11%), Bihar (11%) and Kerala (10%) and relatively high in Punjab (38%) and Tamil Nadu (31%).

Urban

In urban areas, at the national level, the total of scheduled caste and scheduled tribe populations constituted only 18% of total urban population and the social group 'others' constituted 52% of total urban population. Among major States, the proportion of ST population was relatively high only in Orissa (11%) and 7% or less in all other major States. Among major States, the proportion of SC population was relatively high in Punjab (28%) and Haryana (21%). There were only two major States having more than 50% OBC population – Kerala (55%) and Tamil Nadu (68%).

4.6 Distribution of population by MPCE class for different social groups

Statement 6 shows per 1000 distributions of rural and urban persons in different States by MPCE class separately for different social groups with "all groups" column provided for comparison.

It is clear that the MPCE figures for the SC and ST groups were much lower than those for the general population. This is revealed by the much higher proportion of persons falling in the lower MPCE ranges for SC and ST groups compared to the general population. This was true for both rural and urban areas. The MPCE level of the OBC was better than those for SC and ST but not as high as that for population belonging to the social group 'others'.

4.7 Size class of Land Possessed - Rural

Average MPCE by size class of land possessed: Statement 7 shows the average of MPCE for each size class of land possessed separately for each major State and all-India though only for rural areas. It shows that the average of MPCE increases rather slowly with the increase in the area of land possessed, provided one overlooks households having land less than 0.01 hectare. For Kerala, the average MPCE of the population in this size class of land possessed was strikingly high. Even in other States, the lowest size class might depend more on non-agricultural occupations, which explains the exceptional character of average MPCE for this size class.

4.8 Distribution of persons by size class of land possessed: Statement 8 shows the percentage distribution of persons by size class of land possessed for rural areas of major States and all-India. It reveals that the percentage of population with land less than 0.01 hectare was less than 1% only in Kerala and Orissa. The percentage of population possessing 4.01 hectares of land or more was the highest in Rajasthan (22%) followed by Madhya Pradesh (12%), Karnataka (11%) and Punjab (11%). It was the lowest (below 1%) in Kerala followed by West Bengal. At all-India level, households comprising more than 52% of rural population had possessed land not exceeding 0.40 hectare.

4.9 Distribution of population by MPCE class for size classes of land possessed: Statement 9 shows the distribution of persons by MPCE class for different size classes of land possessed at all-India level. It shows that the distribution for the classes 0.41 – 1.00 hectare and 1.01 – 2.00 hectares were more or less

similar to the distribution for 'all classes'. For the class 0.01-0.40 hectare, the distribution was tilted towards lower MPCE values while for the classes above 2.01 hectares the distribution was tilted towards higher values of MPCE.

4.10 Average MPCE by household type, social group and size class of land possessed - a three way classification:

Statement 10 presents the all-India averages MPCE for different combinations of household type, social group and size class of land possessed, along with the corresponding number of sample households for rural India. It reveals that the sample size was not adequate for all the cells of the three-way classification to throw up reliable averages of MPCE even at all-India level. It is found that average MPCE for households differs significantly across household types, social groups and size classes of land possessed. However, the size class of land possessed <0.01 hectare did not follow the same pattern as the other size classes of land possessed in respect of average MPCE of the households. The households having land 4.01 hectares or more had the highest average of MPCE among different size classes of land possessed. This was true for each social group and household type. The exceptions to this general pattern were probably due to sampling fluctuations especially where the sample size was very small.

4.11 Average MPCE by household type and social group

Statement 11 shows the all-India average MPCEs of different combinations of household type, social group along with number of sample households for urban India. It shows that average MPCE for ST households classified as casual labour households had the lowest average MPCE out of 16 basic combinations presented in the Statement. And the highest

average was for the households with 'others' as both social group and household type.

4.12 Break-up of MPCE

MPCE over household types: Statement 12 shows the break-up of MPCE by broad groups of items for each household type at all-India level, separately for rural and urban areas. Corresponding to this statement, the percentages of total expenditure spent on different items are shown in Statement 15. In **rural** India, MPCE for agricultural labour households was the least among the different household types. So, if the spending pattern was similar to other households, the monthly per capita expenditure on different item groups would be expected to be proportionately smaller. This was somewhat true for almost all item groups except cereals, spices and pan, tobacco and intoxicants, for which the consumption level was broadly the same as for some other types of households. Statement 11 presents the average MPCEs of different combinations of household type and social group for urban India. In **urban** India, per capita cereal consumption was relatively low for casual labour households compared to other households. As the total MPCE for casual labour households was the least among different household types, the per capita expenditure on different item groups like cereals and spices appeared to be the least for casual labour households.

4.13 Break-up of MPCE over social groups:

Statement 13 shows the break-up of MPCE by broad groups of items for each social group at all-India level, separately for rural and urban areas. Corresponding to this statement, the percentages of total expenditure spent on different items are shown in Statement 16. In **rural** India, the level of consumption of cereal, meat egg & fish, vegetables, salt were almost the same for household groups other than

'others'. The households with type 'others' normally have relatively high levels of consumption for many groups of items except for spices and second-hand clothing. Their consumption level was also not high for pan, tobacco & intoxicants. In **urban** India, per capita consumption on cereals was the highest for ST households. SC households consumed less of 'beverages, refreshments, etc' than other households. Per capita consumption on vegetables and salt were more or less the same for ST, SC and OBC households.

groups: Statement 14 shows the break-up of MPCE by broad groups of items for each size class of land possessed at all-India level for rural areas. Corresponding to this statement, the percentages of total expenditure spent on different items are shown in Statement 17. In **rural** India, the total MPCE did not vary much over the size class of land possessed. The same was true for per capita consumption expenditure on different groups of items.

4.14 Break-up of MPCE over social

Statement 1R: Average MPCE (Rs) of different household types in rural areas of major States
