

Report No. 463(55/1.0/5)

# Sources of Household Income in India 1999-2000

NSS 55<sup>th</sup> Round  
July 1999- June 2000

**National Sample Survey Organisation  
Ministry of Statistics & Programme Implementation  
Government of India**

**August 2001**

## PREFACE

The National Sample Survey Organisation (NSSO) has been carrying out all- India household surveys on Consumer Expenditure and Employment & Unemployment with a large sample usually once in every five years. The sixth such survey was conducted in the 55<sup>th</sup> round (July 1999-June 2000) - which covered Non- agricultural Enterprises in the Informal Sector in addition. The schedule of enquiry on Consumer Expenditure for the survey was, more or less, similar to that adopted in previous quinquennial rounds.

The present report is the fifth in the series of reports through which the results on consumer expenditure survey are being released. In this report, an attempt has been made to study the differences of various sources of household income over social groups and household occupation types. The sources of income considered for the purpose are: cultivation, fishing/other agricultural enterprises, wage/salaried employment, non-agricultural enterprise, pension, rent, remittances, interest and dividends, and others.

This report has four sections and one appendix. Section 1 of the report is introductory while Section 2 presents Sample Design and Estimation Procedure. Section 3 gives Concepts and Definitions. Section 4 discusses Survey Findings. The detailed tables are provided in the Appendix.

The Field Operations Division (FOD) of the Organisation conducted the fieldwork for the survey. The collected data were processed and tabulated by the Data Processing Division (DPD) of the NSSO. The Survey Design & Research Division (SDRD) of the NSSO developed the survey design and prepared the report.

I am grateful to the Chairman and members of the Governing Council, Heads of various Divisions of the NSSO and their colleagues for the contribution made in preparing the report.

Comments/suggestions from the readers will be most welcome.

New Delhi  
August 2001

N. S. Sastry  
Director General & Chief Executive Officer  
National Sample Survey Organisation

Table 1R	Number per 1000 of households reporting receipt of income from different sources during the period of last 365 days by household type and by State/UT – rural	A-1
Table 1U	Number per 1000 of households reporting receipt of income from different sources during the period of last 365 days by household type and by State/UT – urban	A-18
Table 2R	Distribution of households reporting each source of income over MPCE classes, along with average MPCE, by State/UT – rural	A-35
Table 2U	Number per 1000 of households reporting receipt of income during a period of 365 days from different sources by MPCE class – urban	A-52
Table 3R	Distribution of households receiving income from different combinations of sources by MPCE class, separately by State/UT – rural	A-69
Table 3U	Distribution of households receiving income from different combinations of sources by MPCE class separately by State/UT – urban	A-80
Table 4R	Number per 1000 of households reporting each source of income during the period of last 365 days belonging to different social groups, by State/UT – rural	A-91
Table 4U	Number per 1000 of households reporting each source of income during the period of last 365 days belonging to different social groups by State/UT - urban	A-102
Table 5R	Distributions of households with specified sources of income by size class of land possessed - rural	A-113

# Highlights

- In rural India, the percentage of households reporting income received from ‘cultivation’ and ‘fishing/other agricultural enterprises’ dropped during the period 1987-2000.
- In rural India, the proportion of households reporting income from pension, remittances, and interest and dividends was relatively high for household type “others”. The proportion of households reporting income from ‘pension’ or ‘interest and dividends’ was found to be the lowest for household type “agricultural labour”.
- In rural India, the proportion of households reporting income from pension, rent, remittances and interest and dividends was generally higher for the upper MPCE classes and for social group ‘others’.
- In urban India, the proportion of households reporting income from ‘pension’ or ‘interest and dividends’ was the lowest for casual labour households. The proportion of households reporting income from ‘pension’ or ‘remittances’ was by far the highest for household type ‘others’.
- In rural India, for the combination of sources of income - both rent and non-agricultural enterprises - the percentage of households reporting such combination increased over the MPCE classes.
- In rural India, those households which received income from cultivation had by far the highest average area of land possessed.
- In the rural areas of major States, cultivation was the predominant source of income in Rajasthan (787 out of 1000), followed by Uttar Pradesh and Madhya Pradesh. The proportion of households reporting income from fishing/other agricultural enterprises was the highest (597 out of 1000) in Kerala. In the urban sector also, Kerala showed the highest proportion of households under fishing/other agricultural enterprises (475 out of 1000). ‘Remittances’ was reported by relatively large proportions of households in Kerala (22%) and Bihar (12%).

# Section 1

## Introduction

1.0 During its quinquennial surveys of household consumer expenditure<sup>1</sup> and employment-unemployment, the National Sample Survey Organisation<sup>2</sup> collects some information on sources of income of rural and urban households throughout the country. The summary of such information from NSS 55<sup>th</sup> round are presented in this report. During the survey, the household consumer expenditure schedule was canvassed in 120309 households located in 6046 villages and 4116 urban blocks. This report is the fifth of a series of reports through which the findings of the survey are being released.

---

<sup>1</sup> **Household consumer expenditure survey:** It was originally the practice to collect data on household consumer expenditure in every round of NSS, starting from the very first round (1950-51). From 1972-73, according to a decision of the Governing Council of NSSO, the consumer expenditure survey became a quinquennial feature. It was also integrated with the employment and unemployment survey in the sense that a common sample of households was subjected to both the enquiries. An annual series of smaller-scale consumer expenditure surveys was again launched from the 42nd round (1986-87) to fill the data gaps which planners and researchers had begun to feel. It is the larger-scale quinquennial surveys, however, which are expected to be more useful for the study of trends in the level of consumer expenditure and of the emergence of new spending patterns. The six quinquennial surveys of consumer expenditure have been those of the 27th, 32nd, 38th, 43<sup>rd</sup>, 50<sup>th</sup> and 55<sup>th</sup> rounds of NSS. They relate, respectively, to the years 1972-73, 1977-78, 1983, 1987-88, 1993-94 and 1999-2000.

<sup>2</sup> **The National Sample Survey:** The NSS was set up in 1950, with the idea of having a permanent survey organisation to collect data on various facets of the economy through nationwide sample surveys in order to assist in socio-economic planning and policy-making. The NSS is a continuing survey in the sense that it is carried out in the form of successive "rounds", each round usually of a year's duration covering several topics of current interest in a specific survey period. At present each NSS round reaches, at the all-India level, about 12,000 to 14,000 villages and blocks in the Central sample (covered by the Central agency NSSO) and an independent sample of about 14,000 to 16,000 villages and blocks in the State sample (covered by the Governments of various states and union territories). The entire area of the country - rural and urban - is covered, with the exception of some interior areas of Nagaland and Andaman & Nicobar Islands, and Ladakh and Kargil districts of Jammu & Kashmir.

1.1 Quantitative data on household income are at present not collected in NSS household surveys because of the difficulty of getting reliable data on the subject through direct enquiries. However, no obstacles are encountered in ascertaining *whether or not* a sample household received any income during the last year from cultivation, wage/salaried employment, pension, etc. Such information, though admittedly ineffective in gauging the extent of dependence of the population on particular sources of income, can give a reasonably good idea of differences in the sources of income earned in different regions of the country. If collected at regular intervals, it can also indicate trends in the pattern of income receipts over time. Because of the readiness with which households provide such data and the non-existence of measurement problems, estimates of proportions of households earning income from each source are presumed to be free from non-sampling errors to a large extent.

1.2 Income sources can be classified into income accruing from economic activity and income accruing otherwise. The latter includes income from rent, pension, remittances, interest and dividends. Economic activity includes wage/ salaried employment (regular or casual) and household enterprise. The nine sources considered in this survey were: wage/ salaried employment, three types of enterprise income coming from cultivation, fishing or other agricultural enterprise, and non-agricultural enterprise, and non-gainful incomes, namely, pension, remittances, rent, interest and dividends, and “other sources”.

1.3 Households were also classified in the survey into four or five occupational types and three social groups, and estimates of proportion of households receiving income from any source were generated separately.

1.4 Data on the same subject collected through the same approach in the previous two quinquennial surveys on consumer expenditure (NSS 43<sup>rd</sup> round: July 1987 - June 1988 and NSS 50<sup>th</sup> round: July 1993 - June 1994) have been shown in some of the statements for purposes of comparison.

1.5 A report<sup>3</sup> on the same topic based on results of NSS 50<sup>th</sup> round (July 1993 – June 1994) was brought out earlier. However, the distribution of households by MPCE class was not included in that report.

1.6 The Sample Design and Estimation Procedure followed in the NSS 55<sup>th</sup> round survey is given in Section 2. Section 3 presents some concepts and definitions adopted in the survey and used in this report. The summary of survey findings on the proportions of households reporting income from

---

<sup>3</sup> *Report no. 413: Sources of Household Income in India, 1993-94*

different sources during the last 365 days has been presented in Section 4. The detailed tables at State/UT level are provided in Appendix.

## Section 2

# Sample Design and Estimation Procedure

### 2.1 Sample Design

**2.1.1 General:** A stratified sampling design was adopted for selection of the sample first-stage units (FSU's). The FSU's were villages (panchayat wards for Kerala) for rural areas and Urban Frame Survey (UFS) blocks for urban areas. The ultimate stage units (USU's) were enterprises for schedule 2.0 and households for schedule 1.0/ 10/ 10.1, which were selected by the method of circular systematic sampling with equal probability from the corresponding frame in the FSU. Large FSU's were subdivided into hamlet-groups (rural)/ sub-blocks (urban) that were grouped into two segments, and USU's were selected independently from each of these segments. For the purpose of systematic sampling, households in the frame of second stage stratum 2 were arranged by means of livelihood and land possessed classes for rural samples and by means of livelihood and MPCE classes for urban samples.

**2.1.2 Sampling frame for first stage units:** List of villages (panchayat wards for Kerala) as per 1991 Census and latest lists of UFS blocks were respectively used for selection of rural and urban sample FSU's. For selection of sample villages from the State of Jammu & Kashmir, list of villages as per 1981 Census was used as the sampling frame. It may be mentioned that all the uninhabited villages of the country as per 1991 Census, interior villages of Nagaland situated beyond 5 km of a bus route and inaccessible villages of Andaman & Nicobar Islands were left out of the survey coverage of the NSS 55th round.

### 2.1.3 Stratification

**2.1.3.1 Rural:** Two special strata were formed at the State/ UT level, viz.,

Stratum 1: all FSUs with population between 1 to 100, and

Stratum 2: FSUs with population more than 15,000.

[Note: The above two strata were spread across a given state and were not confined to any particular administrative division within the state.]

The above-noted strata of either type were formed if at least 50 such FSU's were there in the respective frames. Otherwise, they were merged with the general strata.

While forming general strata (consisting of FSU's other than those covered under strata 1 & 2), efforts were made to treat each district as a separate stratum. If limitation of sample size did not allow the formation of many strata, smaller districts within a particular NSS region were merged to form a stratum. Each district with rural population of 2 million or more as per 1991 Census (1.8 million or more as per 1981 Census in case of Jammu & Kashmir) was split into a number of strata.

2.1.3.2 **Urban** : Strata were formed within NSS Regions as follows:

Stratum number	Composition of strata by considering population of various towns as per the 1991 Census
1, 3, 5 *	'hospital area' (HA) / 'industrial area' (IA) / 'bazaar area' (BA) blocks taken together, of each single city with a population of 10 lakhs or more (there could be a maximum of 3 such cities within an NSS Region)
2, 4, 6 *	Other blocks of each single city with a population of 10 lakhs or more
7	HA or IA or BA blocks of all towns with population between 50,000 and less than 10 lakhs
8	Other blocks of all towns with population between 50,000 and less than 10 lakhs
9	HA or IA or BA blocks of all towns with population less than 50,000
10	Other blocks of all towns with population less than 50,000

\* Stratum numbers 3, 4, 5 and 6 remain void if there is only one city in an NSS region with a population of 10 lakhs or more.

If sample size was not adequate for forming so many strata, all blocks of stratum 7 were merged with those of stratum 8 and all blocks of stratum 9 were merged with those of stratum 10.

2.1.4 **Sample size**: A total number of 10,384 FSU's was selected for survey in the *central sample* at all-India level (rural & urban combined) in the 55th round. For *state sample*, there was normally an equal matching. Exceptions were only for Nagaland (urban), Delhi, Goa and Maharashtra (urban) where the state sample size was higher than central sample. Sample for the whole round for each State/UT and sector (i.e., rural/ urban) was allocated equally among the four sub-rounds. Sample FSU's for each sub-round were selected afresh in the form of two independent sub-samples. The details of allocation and survey of FSUs, households and persons were given in Statement 0.

2.1.5 **Allocation of first-stage units (FSU's)**: State/ UT level rural sample size was allocated among the rural strata in proportion to population. State/ UT level urban sample size was first allocated among the three classes of towns (i.e., 10 lakh +, 50000 to less than 10 lakhs and less than 50000) in proportion to population. Then sample allocation for each of the three classes of towns, within an NSS region, was further allocated between two strata types consisting of - (i) HA/ IA/ BA blocks, and (ii) the rest, in proportion to total number of FSU's in the respective frames with double weightage given to

the first category of blocks. Stratum level allocations for both rural and urban areas of a sub-round were made in even numbers in order to facilitate selection of FSU's in the form of two independent sub-samples. Sub-sample numbers were 1 & 2 for sub-round 1; 3 & 4 for sub-round 2; 5 & 6 for sub-round 3 and 7 & 8 for sub-round 4.

**2.1.6 Selection of first-stage units:** For each sub-round, sample FSU's from each stratum were selected in the form of 2 independent sub-samples by following circular systematic sampling with (a) probability proportional to population for all rural strata other than stratum 1, and (b) equal probability for rural stratum 1 as well as all urban strata. Thus, stratum level allocation of FSUs was a multiple of 8.

**2.1.7 Formation of hamlet-groups in large villages and number of hamlet-groups selected for survey :** Depending upon the values of approximate present population (P) and approximate total number of non-agricultural enterprises (E), decision was taken to divide the FSU into a fixed number of hamlet-groups (hg's - the term applicable for rural samples) / sub-blocks (sb's - the term applicable for urban samples) as per the rules given below:

value of P	no. of hg's/ sb's formed in the FSU as per population criterion	value of E	no. of hg's/ sb's formed in the FSU as per enterprise criterion
(1)	(2)	(3)	(4)
Less than 1200	1 @	Less than 100	1 @
1200 – 1999	5	100 – 249	5
2000 – 2399	6	250 – 299	6
2400 – 2799	7	300 – 349	7
2800 – 3199	8	350 – 399	8
(and so on)		(and so on)	

@ no. of hg's/ sb's = 1 means the whole FSU is considered for listing.

[For rural areas of Himachal Pradesh, Sikkim and Poonch, Rajouri, Udhampur and Doda districts of Jammu & Kashmir, number of hg's formed in the village as per population criterion was: 1 for P < 600, 5 for P = 600 to 999, 6 for P = 1000 to 1199, 7 for P = 1200 to 1399, 8 for P = 1400 to 1599, and so on.]

The number (D) of hamlet-groups (hg)/ sub-blocks (sb) formed in the FSU was the higher of the two values as per population and enterprise criteria. If the value of P was less than 1200 (600 for certain hilly areas specified above) as well as the value of E was less than 100 for an FSU, hg/ sb formation was not resorted to and the whole FSU was considered for listing. In case hg's/ sb's were formed in the sample FSU, the same was done by more or less equalizing population.

**2.1.8 Formation of segments within FSU:** The hg/ sb having maximum concentration of non-agricultural enterprises was selected with certainty for listing of households/ enterprises. This hg/ sb was referred to as segment 1. From the remaining (D-1) hg's/ sb's of the FSU, 2 more hg's/ sb's were selected circular systematically and these 2 selected hg's/ sb's together were referred to as segment 2 for doing a combined listing of households/ enterprises. Thus, the listing of households/ enterprises was

done only in segments 1 and 2 of the FSU. The FSU not requiring hg/ sb formation was to be treated as segment 1.

**2.1.9 Stratification of households :** All the households listed in a segment (both rural & urban) were stratified into two second stage strata, viz., ‘affluent households’ (forming second stage stratum 1) and the rest (forming second stage stratum 2). In the rural sector, a maximum of ten households which were relatively affluent compared to others and possessed at least certain item(s) like motor car/ jeep, colour TV, telephone, etc. or owned land / livestock in excess of certain limits were included in second stage stratum 1. In urban sector, the households having MPCE (monthly per capita consumer expenditure) greater than a certain limit for a given town/city were treated as ‘affluent’ households for the present survey and were included in the frame of second stage stratum 1, and the rest of the urban households were included in the frame of second stage stratum 2.

**2.1.10 Number of households/ enterprises selected for survey:** The number of households/ enterprises selected for survey from each FSU in general is given below:

segment	number of households allotted for consumer expenditure schedule		
	second stage stratum (SSS)		
	1	2	total
(1)	(2)	(3)	(4)
<b>FSU with hg/ sb formation:</b>			
<b>1</b>	1	3	<b>4</b>
<b>2</b>	1	7	<b>8</b>
<b>FSU with no hg/ sb formation:</b>			
<b>1</b>	2	10	<b>12</b>

## 2.2 Estimation Procedure:

**2.2.1 Approach:** The estimate for a sub-round was obtained by combining the estimates of the corresponding sub-sample replicates. Similarly, an estimate for the Round was obtained by combining the four sub-round-wise estimates.

**2.2.2** The following notations are being used in this section:

- a = subscript for the a-th stratum
- r = subscript for the r-th sub-sample replicate ( r = 1,2,...,8)
- q = subscript for the q-th sub-round (q = 1,2,3 and 4)
- f = subscript for the f-th sampled village/ block as First Stage Unit ( FSU )
- s = subscript for the s-th segment of sampled village/ block ( s = 1 and 2)
- c = subscript for the c-th 2nd stage stratum of households in the sampled village/ block (c = 1,2)
- j = subscript for the j-th sampled household

- p = subscript for pooled estimate  
z = size used for selection of an FSU from the sampling frame  
Z = total of sizes in the sampling frame for the stratum  
[Note: For urban sector, z=1 and Z=N which is the total number of UFS blocks (FSU's) in the frame.]  
n = number of sampled FSU surveyed within a stratum and a sub-sample replicate (including zero cases but excluding casualty and not reported cases) and used for tabulation  
L= number of sub-sample replicates surveyed and used for tabulation  
D = number of hamlet-groups/ sub-blocks formed in rural/ urban sampled FSU  
H = total number of households listed in the appropriate frame  
h = number of sampled households surveyed and used for tabulation from the frame  
E = total number of enterprises listed in the appropriate frame  
e = number of sampled enterprises surveyed and used for tabulation from the frame  
y, x = value of characteristic y, x obtained in the sample  
 $\bar{y}, \bar{x}$  = estimated value of aggregate of characteristic y, x obtained from the sample.

**2.2.3 ESTIMATES OF AGGREGATE:** In the formulae given in this section,  $\bar{y}$  is the estimate of aggregate of any characteristic y for a given stratum (a), and for a particular sub-round (q) and sub-sample replicate (r). These formulae are provided for the general case of FSU's having two segments 1 and 2. For the FSU's requiring no hg/ sb formation, the formula is identical to that given for segment 1 while the contribution from segment 2 is taken as zero for estimating a characteristic of household from a given 2nd stage stratum (c) in the selection frame

$$\text{Rural : } \hat{Y}_c = \frac{Z}{n} \sum_{f=1}^n \frac{1}{Z_f} \sum_{s=1}^2 B_{fsc} \sum_{j=1}^{h_{fsc}} y_{fscj} \quad (1)$$

$$\text{Here } B_{fsc} = \frac{H_{fsc}}{h_{fsc}}, \text{ for segment 1 (s=1)} \quad \text{and} \quad B_{fsc} = \frac{D_f - 1}{2} \times \frac{H_{fsc}}{h_{fsc}}, \text{ for segment 2 (s=2)}.$$

$$\text{Urban: } \hat{Y}_c = \frac{Z}{n} \sum_{f=1}^n \sum_{s=1}^2 B_{fsc} \sum_{j=1}^{h_{fsc}} y_{fscj} \quad \dots(2)$$

$$\text{Here } B_{fsc} = \frac{H_{fsc}}{h_{fsc}}, \text{ for segment 1 (s=1)} \quad \text{and} \quad B_{fsc} = \frac{D_f - 1}{2} \times \frac{H_{fsc}}{h_{fsc}}, \text{ for segment 2 (s=2)}.$$

*Note: For tabulating any characteristic from this detailed schedule  $\hat{Y} = \sum_c \hat{Y}_c$  is to be used.*

**2.2.3.1 COMBINED ESTIMATE FROM SUB-SAMPLES:** In the previous section, the estimate of a characteristic  $\hat{Y}$  as obtained for a stratum (a), for a particular sub-round (q) and a sub-sample replicate (r), actually represent  $\hat{Y}_{aqr}$ . The combined /pooled estimate for a particular stratum and a particular sub-round is computed as the average of sub-sample replicate estimates and is given below:

$$\hat{Y}_{aq} = \frac{1}{L} \sum_{r=1}^L \hat{Y}_{aqr} \quad \dots(3)$$

**2.2.3.2 ESTIMATE OF AGGREGATES FOR A SUB-ROUND AT STATE/ UT/ REGION**

**LEVEL:** If  $\hat{Y}_{qr}$  be the State/ UT/ Region level aggregate from the r-th sub-sample replicate and q-th sub-round, and  $\hat{Y}_{qp}$ , the combined/ pooled estimate of the aggregate based on the whole sample, for a given sub-round q, then

$$\hat{Y}_{qr} = \sum_a \hat{Y}_{aqr} \quad \dots(4)$$

based on sub-sample replicate group r, and

$$\hat{Y}_{qp} = \frac{1}{L} \sum_{r=1}^L \hat{Y}_{qr} \quad \dots(5)$$

based on all sub-sample replicates.

**2.2.3.3 ESTIMATES OF AGGREGATE FOR THE ROUND (i.e., taking all the 4 sub-rounds together) AT STATE/ UT/ REGION LEVEL:** The estimates of aggregates for the whole round are computed as the simple average of the sub-round estimates derived in section 2.2.2, and are given below:

$$\hat{Y}_r = \frac{1}{4} \sum_{q=1}^4 \hat{Y}_{qr} \quad \dots(6)$$

based on sub-sample replicate 1 and 2\*and

$$\hat{Y}_p = \frac{1}{4} \sum_{q=1}^4 \hat{Y}_{qp} \quad \dots(7)$$

based on whole sample.

*\*Note: In the Round, sub-samples 1, 3, 5 and 7 (in sub-rounds 1 to 4) are combined together to form sub-sample replicate 1 (annual) while sub-samples 2, 4, 6 & 8 (in sub-rounds 1 to 4) are combined together to form sub-sample replicate 2 (annual). This has been followed in the remaining sections also. Stratum level estimate for the Round is obtained similarly.*

**2.2.4 ESTIMATES OF RATIO:** If  $\hat{X}$  and  $\hat{Y}$  be the State/ UT/ Region level aggregate estimate corresponding to variables x and y, then the estimate of ratio is given below:

$$\hat{R}_r = \frac{\hat{Y}_r}{\hat{X}_r} \quad \dots(8)$$

based on sub-sample group r, and

$$\hat{R}_p = \frac{\hat{Y}_p}{\hat{X}_p} \quad \dots(9)$$

based on the whole sample.

The formulae for  $\hat{X}$  are obtained similarly by replacing  $\hat{Y}$  by  $\hat{X}$  and y by x in the above formulae stated in previous sections.

*Note: Estimates for the sub-round  $\hat{R}_{qr}$  and  $\hat{R}_{qp}$  have been obtained by replacing  $\hat{Y}_r$  and  $\hat{Y}_p$  by  $\hat{Y}_{qr}$  and  $\hat{Y}_{qp}$ , respectively and  $\hat{X}_r$  and  $\hat{X}_p$  by  $\hat{X}_{qr}$  and  $\hat{X}_{qp}$ , respectively.*

**Statement 0: Number of villages/ blocks allotted and surveyed and number of households and persons surveyed**

State/UT	no. of villages		no. of blocks		no. of households surveyed		no. of persons surveyed

## Section 3

### Concepts and Definitions

3.0 The concepts and definitions followed in the sixth quinquennial survey on household consumer expenditure are more or less the same as in the earlier rounds. The concepts and definitions of the terms used or relevant in the report have been expanded below.

3.1 **Household:** A group of persons normally living together and taking food from a common kitchen constitutes a household. The word 'normally' means that temporary visitors are excluded but temporary stay-aways are included. Thus, a son or daughter residing in a hostel for studies is excluded from the household of his/her parents, but a resident employee or resident domestic servant or paying guest (but not just a tenant in the house) is included in the employer/host's household. 'Living together' is usually given more importance than 'sharing food from a common kitchen' in drawing the boundaries of a household in case the two criteria are in conflict; however, in the special case of a person taking food with his family but sleeping elsewhere (say, in a shop or a different house) due to space shortage, the household formed by such a person's family members is taken to include the person also. Each inmate of a mess, hotel, boarding and lodging house, hostel, etc., is considered a single-member household except that a family living in a hotel (say) is considered to be one household only; and the same applies to residential staff of such establishments.

3.2 **Household size:** The size of a household is the total number of persons in the household.

3.3 **Household consumer expenditure:** The expenditure incurred by a household on domestic consumption during the reference period is the household's consumer expenditure. The household consumer expenditure is the total of the monetary values of consumption of various groups of items, namely, (i) food, *pan* (betel leaves), tobacco, intoxicants and fuel & light, (ii) clothing and footwear and (iii) miscellaneous goods and services and durable articles.

3.4 For groups (i) and (ii), the total value of consumption is derived by aggregating the monetary value of goods actually consumed during the reference period. An item of clothing and footwear is considered to be consumed if it is brought into maiden or first use during the reference period. The consumption may be out of (a) purchases made during the reference period or earlier; (b) home grown stock; (c) receipts in exchange of goods and services; (d) any other receipt through gift, charity, borrowing; and (e) free collection. Home produce is evaluated at the ex farm or ex factory prices. For evaluating the consumption of the items of group (iii), i.e., items categorised as miscellaneous goods and

*NSS Report No. 463: Sources of Household Income in India, 1999-2000*

services and durable goods, a different approach is followed. In this case, the expenditure made during the reference period for the purchase of goods and services is considered to be consumption.

3.5 It is pertinent to mention here that the consumer expenditure of a household on food items relates to the actual consumption by the normal resident members of the household and also by the guests, whether during ceremonies or otherwise. To avoid double counting, transfer payments like charity, loan, advance, etc., made by the household are not considered consumption for items of groups (i) and (ii), since transfer receipts of these items have been taken into account. However, the item 'cooked meals' is an exception to the rule. Meals prepared in the household kitchen and provided to the employees and/or others would automatically get included in domestic consumption of employer (payer) household. There is a practical difficulty in estimating the quantities and values of individual items used for preparing the meals served to employees or to others. Thus, to avoid double counting, cooked meals received as perquisites from employer household or as gift or charity are not recorded in the recipient household. As a general principle, cooked meals purchased from the market for consumption of the normal resident members and of guests and employees are recorded in the purchaser household.

3.6 This procedure of recording cooked meals served to others in the expenditure of the serving households only leads to bias-free estimates of average per capita consumption as well as total consumer expenditure. However, as the proportions of donors and recipients of free cooked meals are likely to vary in opposite directions over the expenditure classes, the nutritional intake derived from the consumer expenditure survey data may present a somewhat distorted picture. These derived nutrition intakes may get inflated for the rich (net donors) and somewhat understated for the poor (net recipients). This point has to be kept in mind while using the NSS consumer expenditure data for any studies relating to the nutritional status of households.

3.7 **Reference period:** Reference period means the period of time for which data on consumption was collected. The reference period used for the survey was a "moving" one, varying from household to household, although it was a fixed length of period. During the 55<sup>th</sup> round of NSS, information on consumption of food, pan, tobacco & intoxicants was collected independently for two different reference periods of last 30 days and last 7 days from the same households. For items of clothing, footwear, durable goods, education and medical (institutional) expenses, data were collected for the reference period of "last 365 days" preceding the date of survey. For the remaining items, a reference period of "last 30 days" preceding the date of survey was used. However, the monthly per capita consumption expenditure (MPCE) classes in this report are based on data collected for "last 365 days" for clothing, footwear, durable goods, education and medical (institutional) expenses and for "last 30 days" for the rest of the items.

3.8 **Sector :** The word "sector" is used for the rural-urban demarcation: rural and urban are the only two sectors as far as this report is concerned.

3.9 **Major states** : This refers to the following states of India: Andhra Pradesh, Assam, Bihar, Gujarat, Haryana, Karnataka, Kerala, Madhya Pradesh, Maharashtra, Orissa, Punjab, Rajasthan, Tamil Nadu, Uttar Pradesh and West Bengal.

3.10 **Monthly per capita consumer expenditure (MPCE)**: For a household, this is its last 30 days' total consumer expenditure divided by its size. A person's MPCE is understood as that of the household to which he or she belongs.

3.11 **MPCE class**: The MPCE classes are normally revised during quinquennial surveys of Consumer Expenditure. Usually, 12 MPCE classes are formed from a table giving estimated cumulative percentage frequency distribution of persons by MPCE for each sector separately. The upper limits of these classes correspond broadly to 5%, 10%, 20%, 30%, 40%, 50%, 60%, 70%, 80%, 90%, 95% and 100% - of population. The class limits are given below:

sl. no.	rural (in Rs)	urban (in Rs)
1	0 – 225	0 - 300
2	225 – 255	300 - 350
3	255 – 300	350 - 425
4	300 – 340	425 - 500
5	340 – 380	500 - 575
6	380 – 420	575 - 665
7	420 – 470	665 - 775
8	470 – 525	775 - 915
9	525 – 615	915 - 1120
10	615 – 775	1120 - 1500
11	775 – 950	1500 - 1925
12	950+	1925+

The MPCE classes have been assigned to the households on the basis of data with reference period of “365 days” for items of education, institutional medical expenses, clothing, footwear and durable goods and of “last 30 days” for the rest of the items.

Since average household size tends to decrease as MPCE increases, the percentage of households falling in the bottom MPCE classes tends to be smaller than the corresponding percentage of population (5 or 10%), while the percentage of households falling in the higher MPCE classes tends to be larger than 5 or 10%.

3.12 **Household type**: Rural households were classified into five types and urban households into four types on the basis of the occupations pursued by the household type members. The five types of rural households are *self-employed in non-agriculture, agricultural labour, other labour, self-employed in agriculture, and other households*. The four types of urban household are: *self-employed, regular wage / salary earner, casual labour, and other households*.

3.13 The “type” of a household was determined as follows.

### **Rural**

A household was classified as “agricultural labour”, if its income from that source was 50% or more of its total income. The same criterion was followed to classify a household as “self-employed in agriculture”. A household was classified as “self-employed in non-agriculture” if its income from that source was greater than that from rural labour as well as that from all other gainful sources put together. If a household was not one of these three types but its income from total rural labour was greater than that from all self-employment and from other gainful sources, it was classified as “other labour”. The remaining households were classified as “other households”.

### **Urban**

A household was classified as “self-employed”, “regular wage or salary earning”, or “casual labour”, according to the major sources of its income from “gainful employment” during the 365 days preceding the date of survey. A household not having any income from gainful employment was classified under “others”.

3.14 **Social group:** Four social groups were distinguished - scheduled tribe (ST), scheduled caste (SC), other backward classes (OBC) and other households. In case different members of a household belong to different social groups, the group to which the head of the household belongs has been considered as the social group of the household.

3.15 **Land possessed:** The area of land possessed (in hectares) includes land owned, leased in, and (encroached) land neither owned nor leased in, but excludes land leased out. The size classes of land possessed are:

- < 0.01 ha
- 0.01– 0.40 ha
- 0.41-1.00 ha
- 1.01-2.00 ha
- 2.01-4.00 ha
- 4.01+

## Section 4

### Summary of Findings

4.0 These findings are based on nine questions included in the household consumer expenditure schedule. They are: during the last 365 days did the household receive any income from: 1. cultivation? 2. fishing/other agricultural enterprises? 3. wage/salaried employment? 4. non-agricultural enterprises? 5. pension? 6. rent? 7. remittances? 8. interest and dividends? 9. other sources ?

The percentage of households reporting income from each of the above nine sources was tabulated by sector, State/UT, household type, household social group and MPCE class. The detailed results are presented in the appendix.

#### 4.1 Trends at all-India level

4.1.1 Trends in proportions of households reporting receipt of income from different sources for each household type during the period of last 365 days is presented in Statement 1 for rural and urban areas separately.

##### Rural

4.1.2 In rural India, taking all household types together, the percentage of households reporting income received from cultivation and fishing/other agricultural enterprises dropped during the period 1987-2000. For the remaining sources of income, there was a slight increase in the proportion of households reporting income received. However, for remittances and interests and dividends, the increase in the proportion was marked from 43<sup>rd</sup> round (1987-88) to 50<sup>th</sup> round (1993-94). But since then, the increase in proportion has been much smaller for remittances and near zero for interest and dividends.

##### Urban

4.1.2 Overall, taking all household types together, the proportions of households reporting different sources of income are quite different for urban India from those found for rural India. The proportions fell to some extent for cultivation, fishing and other agricultural enterprises and wage/salaried employment, and rose for pension, and interest and dividends. However, the proportion of households reporting income from remittances and also from interest and dividends has fallen from 1993-94 to 1999 - 2000.

NSS Report No.463: Sources of Household Income in India, 1999-2000

## 4.2 The pattern of variation over household types

4.2.1 The household type is determined on the basis of the source of income received by a household from different types of occupation. Therefore, household type of a household should be consistent with its source of income.

This fact is more or less corroborated in Statement 1. However, the Statement reveals some minor discrepancies between household type and reported source of income. Such discrepancies can generally be attributed to the 'not recorded cases'.

### Rural

4.2.2 The proportion of households reporting income from pension, remittances, and interest and dividends was relatively high for household type 'others'. The proportion of households reporting income from pension or interest and dividends was found to be the lowest for household type 'agricultural labour'.

### Urban

4.2.3 In urban India, the proportion of households reporting income from pension as well as interest and dividends was the lowest for casual labour households. The proportion of households reporting income from pension or remittances was the highest for household type 'others'.

Although there was a declining trend in the proportion of 'all households' reporting income from wage/salaried employment, the corresponding proportions for the household type 'regular wage/salaried' have shown stability, if not improvement over the period 1987-2000.

## 4.3 The pattern of variation over MPCE classes

4.3.1 Statement 2 gives the distribution of households receiving income from different sources during the period of last 365 days by MPCE class at all-India level for both rural and urban areas. For comparison, one has to keep in mind the distribution of households by MPCE class given in the last column (col. 11) to make out the variation in the distribution by MPCE class for a specific source of income.

4.3.2 In rural areas, compared to average MPCE reported by all households (Rs 486) the average MPCE was not much different for households reporting cultivation or non-agricultural enterprises, but somewhat higher (Rs 536) for households reporting fishing /other agricultural enterprises and somewhat lower (Rs 450) for those reporting wage/salaried employment. Average MPCE of the households reporting income from interest and dividends was the highest (rural- Rs 753, urban- Rs 1346) followed by households reporting income from pension (rural- Rs 691, urban- Rs 1119). The source wise distributions of households over MPCE classes deviated from the overall distribution for all sources in ways that could be expected from the differences in average MPCE. Thus, in **rural** India, the proportions of households reporting income from pension, rent, remittances, and interest and dividends were

relatively high for the top MPCE classes. The proportions were relatively high in lower MPCE classes, particularly for households reporting income from wage/salaried employment.

**Statement 2: Number per 1000 of households reporting receipt of income from different sources during the period of last 365 days by MPCE class**

1925 & above	28	37	32	48	51	52
all classes	1000	1000	1000	1000	1000	1000
average MPCE (Rs)	700	684	769	748	759	867
no. of sample hhs	1085	1642	80	5931	3377	906

4.3.4 The averages of MPCE in Statement 3 should be compared with the all-sources averages in Statement 2: Rs 486 for rural and Rs 855 for urban. The averages were markedly higher for “both rent and non-agricultural enterprises” (Rs 632) and “both agricultural and non-agricultural enterprises” (Rs 530) and markedly lower (Rs 432) for “both agriculture and wage/salarid employment” in rural India. For urban India, all but the last column shows average MPCE much below the overall average of Rs 855.

In the rural areas, the percentage of households receiving income from agriculture only has increased over MPCE classes up to MPCE Rs 615 and thereafter decreased. For the

combination of sources of income 'both agriculture and wage/salaried employment', the percentage of households reporting income was 10-11% for MPCE between Rs 255 to Rs 470. For the combination 'both agriculture and non-agricultural enterprise', the distribution did not depict any special pattern over MPCE classes. The same was true for the combination of sources 'both wage/salary and non-agricultural enterprises'. However, the percentage of households for the combination 'both rent and non-agricultural enterprises' was low for lower MPCE classes and high for higher MPCE classes. This percentage was the highest (21%) for the MPCE class Rs. 525-615.

#### 4.4 The pattern of variations across social groups

4.4.1 The distribution of households by social group reporting each source of income during the period of last 365 days is given in Statement 4 for rural and urban areas. As mentioned in para 4.31, one has to keep in mind the distribution of households by social group given in the last column (col. 11) to make out the variation in the distribution by social group for a specific source of income. In **rural** India, the proportions of ST households reporting income from non-agricultural enterprises, pension, interest and dividends were relatively low compared to other households. The proportions of SC households reporting income from cultivation, fishing/other agricultural enterprises and interest and dividends were relatively low while the proportions of households reporting income from wage/salaried employment

**Statement 5 : Number per 1000 of households reporting receipt of income during a period of 365 days from different sources by household social group**

Household social group	cultivation	fishing /other agr. enterprises	wages/ salaried employment	non-agr. enterprises	pension	rent	remit-tances	interest and dividends	others	all
(1)	(2)	(3)	(4)	(5)	(6)	(7)	(8)	(9)	(10)	(11)
<b>Rural</b>										
<b>All India</b>										
scheduled tribe	127	122	129	52	41	32	54	38	132	109

were relatively high. In **urban** India, the proportions of SC households reporting income from pension, rent and interest and dividends were relatively low. For OBC households, the proportions of households reporting income from interest and dividends and pension were

relatively low and from fishing/other agricultural enterprises and cultivation were relatively high.

#### 4.5 The pattern of variation over size classes of land possessed: Rural

4.5.1 Statement 5 gives the distribution of households by size class of land possessed for each source of income received by the households for rural areas at all-India level. It shows that the households possessing higher size of land generally reported that they had received income from cultivation or fishing/other agricultural enterprises.

The households receiving income from cultivation had the highest average area of land possessed. The average area of land possessed was the least for the households which received income from wage/salaried employment or from non-agricultural enterprises only.

#### Statement 5: Distributions of households with specified sources of income over size classes of land possessed

size class of land possessed (ha)	per 1000 no. of households among those with specified source of income

#### 4.6 Inter-state variation in the sources of income

4.6.1 Some sources for which inter-state differences were significant are highlighted in Figures 1 to 4. Statement 6 gives number per 1000 of households that reported income from different sources during the period of last 365 days in rural and urban areas for 15 major States and all-India. In rural areas, cultivation was the predominant source of income in Rajasthan (787 out of 1000), followed by Uttar Pradesh and Madhya Pradesh. The proportion of households reporting income from fishing/other agricultural enterprises was the highest in

*NSS Report No.463: Sources of Household Income in India, 1999-2000*

Kerala. The proportion of households reporting income from wage/salaried employment was the highest in Tamil Nadu (711 out of 1000) followed by Maharashtra. But, it was the lowest for Rajasthan (42%) and UP (41%).

**Statement 6: Number per 1000 of households reporting receipt of income from different sources during the period of last 365 days for each major State**

In the urban sector, Kerala showed by far the highest proportion of households under 'fishing/other agricultural enterprises' (475 out of 1000). 'Remittances' were reported by relatively large proportions of households in Kerala (22%) and Bihar (12%), 'interest and dividends' were reported most frequently from Gujarat, Maharashtra, West Bengal and Kerala.

**Figure 1**  
Per 1000 no. of rural hhs reporting income from cultivation and from fishing/other agricultural enterprises in different states

**Figure 2**  
Per 1000 no. of hhs reporting income from non-agricultural enterprises in different states

## Detailed tables

Tables 1R and 1U: Number of sample households in last column and last row are not equal as the last row excludes 'not recorded' cases for household types.

Tables 3R, 3U, 4R, 4U and 5R: All entries in the columns having number of sample households less than 20 were replaced by a dash (-).

Tables 4R and 4U: Number of sample households in last column and last row are not equal as the last row excludes 'not recorded' cases for social groups.

**Table 1R : Number per 1000 of households reporting receipt of income from different sources during the period of last 365 days by household type, and by State/UT Rural**
