PART I - ARTICLES & NOTES

1. A Note on Nutritional Intake in India-NSS 50th Round (July 1993 - June 1994) 1-50
2. A Note on Sources of Household Income in India-NSS 50th Round (July 1993-June 1994) 51-64
3. A Note on Participation of Indian Women in Household Work and Other Specified Activities-NSS 50th Round (July 1993-June 1994) 65-89
4. A Note on Economic Activities and School Attendance by Children of India-NSS 50th Round (July 1993-June 1994) 90-104

PART II - SURVEY RESULTS

1. Survey Results on Nutritional Intake in India-NSS 50th Round (July 1993 - June 1994) S-1 to S-214
 2. Survey Results on Sources of Household Income in India-NSS 50th Round (July 1993-June 1994) S-215 to S-265
 3. Survey Results on Participation of Indian Women in Household Work and Other Specified Activities-NSS 50th Round (July 1993-June 1994) S-266 to S-284
 4. Survey Results on Economic Activities and School Attendance by Children of India-NSS 50th Round (July 1993-June 1994) S-285 to S-345
- Appendix A-1 to A-5

PART III - HINDI SECTION

- Hindi Section हि० 1 - हि० 25

HIGHLIGHTS OF THE NEXT ISSUE

NSS 50th Round (July 1993 - June 1994) Results on:

- 1) Differences in level of consumption among socio economic groups
- 2) Wages in kind, exchange of gifts and expenditure on ceremonies & insurance in India
- 3) Reported adequacy of food intake in India
- 4) Consumption of tobacco in India

PART III - HIGHLIGHTS

ARTICLES/NOTES

1. A Note on Nutritional Intake in India-NSS 50th Round (July 1993 - June 1994)
2. A Note on Sources of Household Income in India-NSS 50th Round (July 1993-June 1994)
3. A Note on Participation of Indian Women in Household Work and Other Specified Activities-NSS 50th Round (July 1993-June 1994)
4. A Note on Economic Activities and School Attendance by Children of India-NSS 50th Round (July 1993-June 1994)

A Note on Nutritional Intake in India NSS-50th Round (July 93-June 94)

SECTION ONE

INTRODUCTION

1.0 Background : The 50th round of NSS was the fifth quinquennial survey on consumer expenditure and employment-unemployment. According to a decision of the Governing Council of NSSO, consumer expenditure and employment surveys are carried out simultaneously every five years. The previous four quinquennial surveys were the 27th (Oct. 1972 - Sept. 1973), the 32nd (July 1977 - June 1978), the 38th (Jan-Dec. 1983), and the 43rd (July 1987- June 1988) Rounds of NSS. In other rounds, too, consumer expenditure inquiry on a lesser scale is being carried out starting from the 42nd round (1986-87) onwards side by side the main topic of enquiry. From the 45th round onwards the subject coverage of this enquiry has been broadened to include some important aspects of the activity pattern of the household members so that an annual series of consumer expenditure and employment data becomes available. While these smaller-scale surveys are conducted over a period of 12 months or six months, the quinquennial (full-scale) surveys have all been of complete year's duration.

1.1 In the quinquennial surveys two separate schedules are canvassed - sch.1.0 for consumer expenditure and sch.10 for employment situation - in each sample household, enabling thereby cross-tabulation of variates on consumer expenditure and employment. The present document, however, is based on only nutritional intake per person/consumer unit per day derived from the data collected through schedule 1.0.

1.2 The survey period of the 50th round was from July 1993 to June 1994. The geographical coverage of the survey was to be the whole of the Indian Union except Ladakh and Kargil districts of Jammu & Kashmir, 768 interior villages of Nagaland and 172 villages in Andaman & Nicobar Islands which remain inaccessible throughout the year. However, certain districts of Jammu & Kashmir viz., Doda, Anantnag, Pulwama, Srinagar, Badgam, Baramullah and Kupwara, and Punjab's Amritsar district, had to be excluded from the survey coverage due to unfavourable field conditions.

1.3 In all, 115354 households were interviewed, spread over 6951 sample villages and 4650 sample blocks. Ten households were selected for survey in each selected village / urban block.

1.4 The survey period of one year was divided into four sub-rounds of three months each with allocation of equal numbers of sample villages and blocks to each of the four sub-rounds viz.,

- sub-round 1 : July-Sept'93;
- sub-round 2 : Oct.-Dec'93;
- sub-round 3 : Jan.-Mar'94;
- sub-round 4 : Apr.-June'94

1.5 The results of the survey presented, in this issue give an idea regarding nutritional intake of the population belonging to different monthly per capita expenditure classes from different items of food. The nutritional intake of a sample household has been measured by converting the quantities of the items of food consumed by the household into equivalent amounts of energy, protein and fat (see Appendix).

1.6 To study the nature and extent of change in the distribution of population by monthly per capita expenditure class while examining the effect of adjustment of energy intake in the distribution of population over various energy intake levels ancillary information was sought in the ROUND besides those usually required for measuring total consumer expenditure and nutritional intake for a household/person.

1.7 Basing on the combined sample (both of sub-sample 1 & 2) data, this issue summarises the detailed results of the survey on the nutritional intake. The Sampling Design and Estimation Procedure followed in this survey round is figuring in the following section. Section Three briefly elaborates on the important concepts and definitions adopted in the survey and the survey findings are examined in section Four. The detailed data tables on nutritional content of various food items are given in Part II.

SECTION TWO

SAMPLE DESIGN & ESTIMATION PROCEDURE

2.0 Sample Design : A stratified two-stage sampling design was adopted, with census villages as first stage units (fsu's) in the rural sector and Urban Frame Survey (UFS) blocks in the urban, except for a few newly declared towns according to the 1991 census, for which UFS frames were not available. For them, census enumeration blocks (EB's) were used as first stage units. Households formed the second stage units in both rural and urban sectors.

2.1 Sampling frame for fsu's : In the rural sector, the sampling frame was provided sometimes by the 1981 census list of villages and sometimes by the 1991 census list of villages, depending on the sub-round (see para 1.4) and the state/union territory being surveyed, as follows.

2.1.1 In the following areas of rural India (hereafter referred to as **Group A areas**), the **1981** census lists of villages served as the sampling frame for **all 4 sub-rounds** :

Jammu & Kashmir - where the 1991 census was not conducted.

Agra district of U.P. and Durg, Sagar and Morena districts of M.P. - for which the available information for 1991 was incomplete.

2.1.2 In the following areas of rural India (hereafter referred to as **Group B areas**), the **1991** census lists of villages served as the sampling frame for **all 4 sub-rounds** :

Andhra Pradesh, Assam, Kerala, Orissa, W.Bengal & Chandigarh.

U.P. and M.P. (excepting Group A areas).

2.1.3 In the remaining states/u.t.'s of rural India (hereafter referred to as **Group C areas**), the **1981** census lists of villages were used as sampling frame for **sub-round 1** and the **1991** census lists used for **sub-rounds 2 to 4** in order to make use of the latest available information in the sample selection process.

2.1.4 For Nagaland, the villages situated within 5 km of a bus route constituted the sampling frame. For the Andaman & Nicobar Islands, the villages which remain inaccessible throughout the year were, as usual, excluded from the sampling frame.

2.1.5 In the urban sector, the lists of NSS Urban Frame Survey (UFS) blocks were the sampling frames used in most cases. However, 1991 census house listing enumeration blocks were considered as the sampling units for some of the newly declared towns of the 1991 population census, for which UFS frames were not available.

2.2 Stratification : As usual, each state/union territory (u.t.) was divided into one or more agro-economic regions by grouping contiguous districts which are similar with respect to population density and crop pattern. In Gujarat, however, some districts were sub-divided for the purpose of region formation on the basis of location of dry areas and the distribution of tribal population in the state. The total number of regions formed in the whole of India was 78.

2.2.1 In the rural sector, within each region, each district normally formed a separate stratum. However, if the census population of the district according to the sampling frame used exceeded 1.8 million / 2 million (depending on whether 1981 or 1991 census frame was used), the district was split into two or more strata by grouping contiguous tehsils. In Gujarat, however, in the case of districts extending over more than one region, the portion of a district falling in each region constituted a separate stratum even if the rural population of the district as a whole was less than 1.8 million / 2 million.

2.2.2 In the urban sector, strata were formed, again within NSS regions, on the basis of town population. In order to be able to allocate a larger proportion of the sample to the affluent section of society and thus improve the precision of the overall estimate of consumer expenditure, the usual first-stage stratification procedure was modified as follows. Urban blocks in towns with census population 400,000 or more were placed in different strata depending on whether they belonged to the "affluent" area of the town or not - the information on affluent areas being supplied by the regional/sub-regional field offices of NSSO. Full details of urban stratification are given below.

stratum	composition
1	towns with population less than 50,000
2	towns with population 50,000 - 199,999
3	towns with population 200,000 - 399,999
4	towns with population 400,000 - 999,999
	: affluent areas

- 5 towns with population 400,000 - 999,999
: other areas
- 6 a single city (if any) with population 1
million or more : affluent areas
- 7 a single city (if any) with population 1
million or more : other areas
- 8 another city (if any) with population 1
million or more : affluent areas
- 9 another city (if any) with population 1
million or more : other areas

2.3 **Allocation of sample** : The first-stage sample size for any state/union territory of India was allotted to the rural and urban sectors in consideration of the relative sizes of the rural and urban population with double weightage to the urban sector.

2.3.1 Within the **urban** sector of a state/u.t., allocation of the sample to the different urban strata was done in proportion to stratum population with double weightage to affluent strata - that is, strata 4, 6 & 8 (see para 2.2). Stratum level allocations were adjusted to multiples of 8 as far as possible so as to have equal allocations for each sub-sample-sub-round combination.

2.3.2 Within the **rural** sector of a state/u.t., allocation of the sample to the different rural strata was done as follows.

2.3.3 For Group B areas (see para 2.1), the state/u.t. level rural sample was allocated to the different rural strata in proportion to 1991 census population. For other areas (Group A and Group C), allocation was initially made on the basis of 1981 census population. Stratum level allocations were adjusted to multiples of 8 as far as possible so as to have equal allocations for each sub-sample-sub-round combination.

2.3.4 However, for Group C areas, the original allocations for sub-rounds 2 to 4 were revised as follows. The total state/u.t. level allocation for sub-rounds 2 to 4 combined - 75% of the total as 25% had gone to sub-round 1 - was re-allocated to the rural strata in proportion to stratum population as per 1991 census. Stratum level allocations were adjusted to multiples of 6 as far as possible so as to have equal allocations for the remaining sub-sample-sub-round combinations.

2.4 **Selection of fsu's** : Sample villages - except in Arunachal Pradesh - were selected by PPS circular systematic sampling (with population as the size variable) from the appropriate sampling frame as explained in para 2.1, in the form of two independent sub-samples. Sample blocks were selected by ordinary (equal probability) circular systematic sampling, also in the form of two independent sub-samples.

2.4.1 In Arunachal Pradesh the sample of villages was drawn by a cluster sampling procedure. The field staff were supplied with a list of sample "nucleus" villages and were advised to select clusters of villages - building up each cluster around a nucleus village - according to prescribed guidelines. The nucleus villages were selected circular systematically with equal probability, in the form of two independent sub-samples.

2.5 **Selection of hamlet-groups/sub-blocks** : To reduce workload the following procedure was adopted in drawing up the second-stage sampling frame. Larger sample villages and blocks were divided - according to usual NSS practice - into a suitable number of "hamlet-groups"/"sub-blocks" of roughly equal population content : the second-stage sampling frame was constituted of the households belonging to only two of these hamlet-groups, selected circular systematically, in case of sample villages, and one randomly selected sub-block in case of sample blocks (instead of the whole village/block). No hamlet-group formation was, however, done in Arunachal Pradesh. In Kerala, practical difficulties arose in hamlet-group formation during sub-round 1. These were resolved by selecting, instead of two hamlet-groups, two EB's from the constituent EB's of large villages.

2.6 **Selection of households** : The affluent classes of society have expenditure levels spread over a very wide section of the consumer expenditure range. As a result, the contribution of these classes to the sampling error of a consumer expenditure survey is large compared to that of an equal-sized chunk of population belonging to the more homogeneous "middle classes" (say). To improve the efficiency of consumer expenditure estimates, it was decided that the second-stage sampling frames ought to be stratified in such a way as to be able to allocate a larger proportion of the sample to the affluent sections of the population wherever they could be located.

2.6.1 **Rural** : In sample villages, households in the second-stage sampling frame were divided into two strata as follows. Households - if any - exhibiting signs of affluence such as the possession of any of a specified list of assets including land in excess of a certain specified area, or a member holding a good salaried job or belonging to a paying profession such as that of a doctor or advocate, were designated "affluent households" and the top 10 such households (subject to availability) placed in stratum 1. The remaining households formed second-stage stratum 2. Two households were selected circular systematically from second-stage stratum 1. From second-stage stratum 2, eight households were selected circular systematically after arranging the households in the stratum by "means of livelihood" ; this meant that households "self-employed in agriculture" were placed first, followed by "rural labour"

households, and then the "others". Further, the households under "others" were arranged in five different land-possessed classes to ensure spread of the sample over households of different economic statuses.

2.6.2 Urban : In sample blocks, households with monthly per capita consumer expenditure (as reported at the time of household listing) Rs. 1200 or more (Rs. 1500 or more in towns with population one million and above) were placed in second-stage stratum 1 and the rest in second-stage stratum 2. In sample blocks belonging to first-stage strata 4, 6 & 8 (affluent areas of towns with population 4 lakhs or more), as many as **four** sample households were selected for survey from second-stage stratum 1 and **six** from second-stage stratum 2. In all strata other than those numbered 4, 6 & 8, **two** sample households were selected from second-stage stratum 1 and **eight** from second-stage stratum 2. In each case the sample of households, for each second-stage stratum, was drawn circular systematically with a random start. The households in second-stage stratum 2 were, prior to sample selection, placed in eight different groups and the different groups of households placed one after another in a specified order to ensure spread of the sample over the different groups. The grouping was done on considerations of means of livelihood (self-employed / regular wage or salary earning / casual labour / others) and household monthly per capita consumer expenditure.

2.7 Sample size : This report covered, in all, 115354 households spread over 11601 sample villages/blocks. The number of sample villages and blocks allotted and surveyed, and the number of sample households and persons surveyed, are given for different state/u.t.'s and all-India in Statement 0, separately for rural and urban sectors.

2.8 Estimation Procedure

2.8.1 Estimation of aggregates at sub-sample level : Aggregates are first estimated at sub-sample level according to the following estimation formulae, where \hat{Y} denotes the estimate - based on one sub-sample - of the aggregate of a given characteristic Y for a sector of a state/u.t. For the **rural sector** of a state/u.t. **other than Arunachal Pradesh**,

$$\hat{Y} = \sum_s \frac{1}{n_s} \sum_{i=1}^{n_s} \frac{P_{si} D_{si}^*}{P_{si}} \sum_{t=1}^2 \frac{H_{sit}}{h_{sit}} \sum_{j=1}^{h_{sit}} y_{sitj}$$

For the **rural sector** of **Arunachal Pradesh**,

$$\hat{Y} = \sum_s \frac{1}{n_s} \sum_{i=1}^{n_s} N_{si} \sum_{t=1}^2 \frac{H_{sit}}{h_{sit}} \sum_{j=1}^{h_{sit}} y_{sitj}$$

For the **urban sector** of a state/u.t.,

$$\hat{Y} = \sum_s \frac{N_s}{n_s} \sum_{i=1}^{n_s} D_{si} \sum_{t=1}^2 \frac{H_{sit}}{h_{sit}} \sum_{j=1}^{h_{sit}} y_{sitj}$$

where

y : observed value of the same characteristic in a sample household

s : stratum suffix

i : sample village/block suffix

t : second-stage stratum suffix

j : sample household suffix

D : number of hamlet-groups/sub-blocks formed in the surveyed village/block

H : number of households listed in the second-stage sampling frame

h : number of sample households surveyed

p : population of sample village as in the sampling frame

N : for the urban sector, number of blocks in the sampling frame

n : number of sample villages/blocks surveyed in this sub-sample

P_{si} : population of the s -th stratum as per frame used in the selection of i -th sample village of the stratum

N_{si} : for Arunachal Pradesh, number of sample villages in the sampling frame for s -th stratum which was used in selection of i -th sample village of the stratum

D^* : equals 1, if $D = 1$

equals $D/2$ if $D > 1$

2.8.2 Estimation of aggregates for the combined sample (pooling sub-samples) : The combined sample estimate of an aggregate is obtained as the simple average of the corresponding sub-sample estimates.

2.8.3 Estimates of ratios : The estimate of a ratio of the form $R = Y/X$, where Y and X are the population aggregates of two characters, is obtained as

$$\hat{R} = \frac{\hat{Y}}{\hat{X}}$$

where \hat{Y} and \hat{X} are estimates of Y and X obtained according to the procedure laid down in paras 2.8.1 and 2.8.2. Examples of ratio estimates are rates and percentages.

SECTION THREE

CONCEPTS AND DEFINITIONS

3.0 The concepts & definitions as followed in the household consumer expenditure survey during 50th round are broadly in lines of recent past rounds. A few of those relevant to this document are given below :

3.1 **Household** : A group of persons normally living together and taking food from a common kitchen constitutes a household. The qualification "normally" extends to cover only temporary stay aways but not temporary visitors, in the group. Thus a member residing outside, in a hostel, for studies is not counted as a household member, but a resident employee or resident domestic servant or a paying guest (but not just a tenant in the house) is counted as a member of his/her employer's household. Of the two criteria, "Living together" is usually stressed upon rather than "sharing food from a common kitchen" in drawing the boundaries of a household in case both cannot be accommodated due to mutual conflict. However, in the special case of a person taking food from the common family kitchen while regularly spending nights somewhere else (say in a shop or in a different house for sleeping) due to reasons of security of the shop or other insufficiencies in the family household premises, the household formed by such a person's family members is taken to include the person also. Each inmate of a mess, hotel, boarding and lodging house, hostel, etc. is considered as a single-member household except that a family living in a hotel (say) is considered to form only one household; similar condition is applicable to residential staff of such establishments.

3.2 **Household size** : The size of a household is a total count of persons in the household.

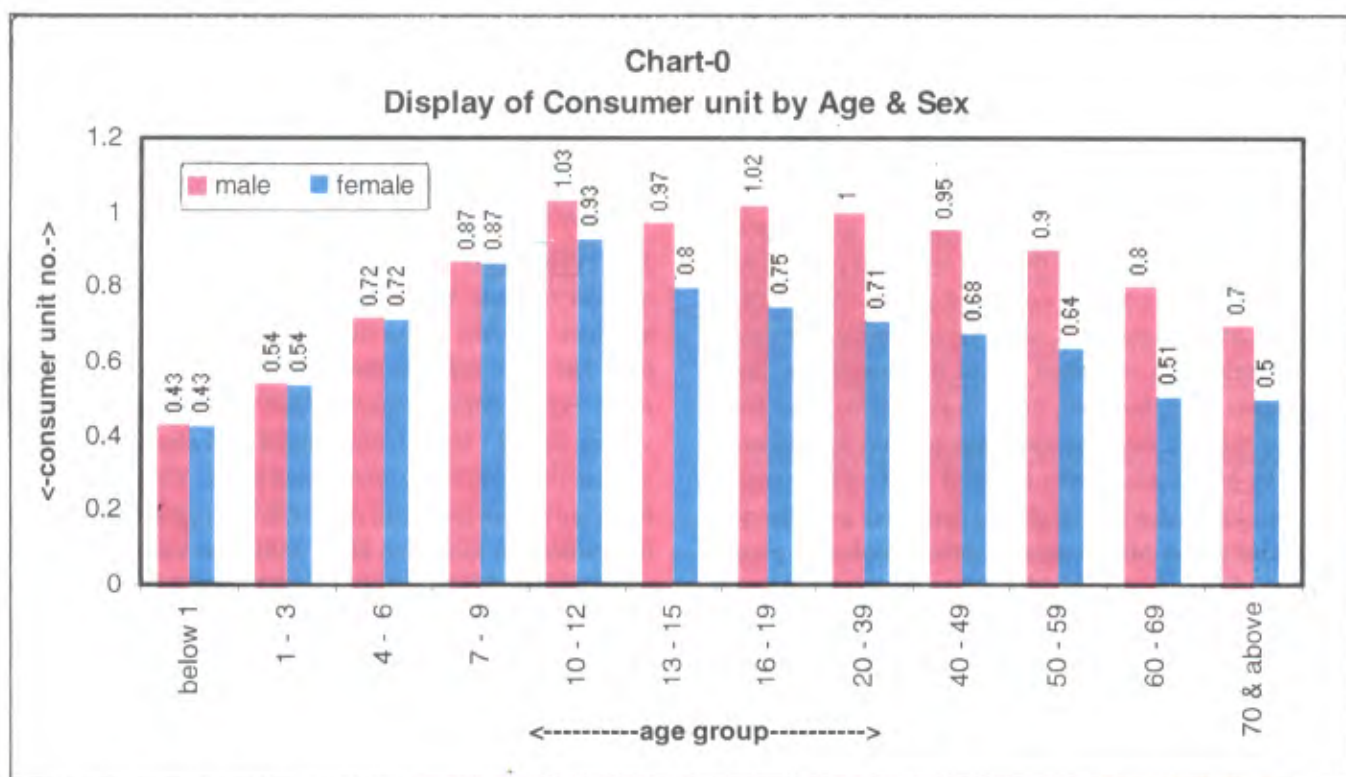

3.3 **Consumer unit**: A person of a particular sex & age group is represented by an index (consumer unit number) according to the requirement of energy in terms of standard applicable to a "reference man". A MALE in the age group 20-39 is considered as a standard known as the "reference man" and his per diem energy requirement forms a single consumer unit. The indices representing the energy requirement levels per diem of the different members of a household irrespective of age & sex are added together to derive the total number of consumer units in that household with the help of the table below showing age-sexwise indices. Age-sex specific indices are as follows :

Consumer Unit by age & sex

Age group (in completed years) (1)	sex	
	male (2)	female (3)
below 1	0.43	0.43
1 - 3	0.54	0.54
4 - 6	0.72	0.72
7 - 9	0.87	0.87
10 - 12	1.03	0.93
13 - 15	0.97	0.80
16 - 19	1.02	0.75
20 - 39	1.00	0.71
40 - 49	0.95	0.68
50 - 59	0.90	0.64
60 - 69	0.80	0.51
70 and above	0.70	0.50

3.4 **Household consumer expenditure** : The expenditure incurred by a household on domestic consumption during the reference period is the household's consumer expenditure. The household consumer expenditure is the sum total of the monetary values of consumption of various groups of items namely (i) food, pan (betel leaves), tobacco, intoxicants and fuel & light, (ii) clothing and footwear and (iii) miscellaneous goods and services and durable articles.

3.4.1 For groups (i) and (ii), the total value of consumption is derived by aggregating the monetary value of goods actually consumed during the reference period. An item of clothing and footwear would be considered to have been consumed if it is brought into maiden or first use during the reference period. The consumption may be out of (a) purchases made during the reference period or earlier; (b) home grown stock; (c) receipt in exchange of goods and services; (d) any other receipt like gift, charity, borrowing and (e) free collection. Home produce is evaluated at the ex farm or ex factory rate. For evaluating the consumption of the items of group (iii) i.e. items categorised as miscellaneous goods and services and durable articles, a different approach is followed. In this case, total amount of money spent during the reference period for the purchase of goods and services is treated as consumption expenditure.

3.4.2 It is pertinent to mention here that the consumer expenditure of a household on food items relates to the actual consumption by the normal resident members of the household and also by the occasional guests & visitors whether during celebrations or otherwise. Transfer payments like charity, loan advance, etc. made by the household are not reconsidered to avoid duplicacy while counting them in payer household as consumption for items of groups (i) and (ii), since transfer receipts of these items have been taken into account there. However, the item "cooked meals" is an exception to the rule. Meals prepared in the household kitchen and provided to the employees and/or others would automatically get included in domestic consumption of employer (payer) household. There is a practical difficulty of estimating the quantities and values of individual items used for preparing the meals served to employees or to others. Thus, to avoid double counting, cooked meals received as perquisites from employer household or as gift or charity are not recorded in the recipient household. As a general principle, cooked meals purchased from the market for consumption of the normal resident members and for guests and employees will also be recorded in the purchaser household.

3.4.3 The aforementioned procedure by which value of cooked meals served to others is accounted for in the expenditure of the serving households only leads to bias-free estimates of

average per capita consumption as well as total consumer expenditure. The variation of the number of donors and recipients of free cooked meals are likely to be in opposite directions over the expenditure classes. As a matter of fact most of the donors of cooked meals will be in the upper MPCE classes whereas most of the recipients will be in the lower ones. The nutritional intake derived from the consumer expenditure survey data need to be presented taking care of this aspect.

3.5 **Reference period** : Consumption data are collected with a reference period of "last 30 days", i.e. the 30 days just preceding the date of survey. The reference period used for the survey, in other words, is a "moving" one, varying from one household to another depending upon the day of data collection.

3.6 **Monthly per capita expenditure (MPCE)** : For a household, MPCE is obtained as the ratio of the total household consumer expenditure during a period of 30 days and the household size. A person's MPCE is understood to be, the MPCE figure derived for the household to which he/she belongs.

3.7 **MPCE classes** : It is customary in NSS consumer expenditure reports, to present various estimates, including state and all-India level values of different indicators, socio-

economic or else nutrition related and distributions of households and persons over different socio-economic classes and calorie intake level basing on categorisation of the population according to per capita monthly expenditure i.e. MPCE. For the 50th round, 12 MPCE classes were formed in each sector - rural and urban - as follows. For the rural (urban) sector, the class limits of MPCE were so chosen that each class, excepting for the two pair of classes one pair each at the ends, approximately contained an estimated 10% of the rural (urban) population, while the remaining four classes each contained an estimated 5% of the population. Some adjustments were, however, made to keep some class limits commensurate between the rural and urban sectors. Tabulation of result: by MPCE class from the 43rd to the 49th round of NSS was done using MPCE classes derived in a similar way, using 43rd round MPCE data. In other words, the present updation of classification on MPCE is second to the one made during the 43rd round. The classification evolved for the two sectors of population based on the 50th round is as follows:

MPC Expenditure level	Rural (Rs.)	Urban (Rs.)
1.	below 120	below 160
2.	120 - 140	160 - 190
3.	140 - 165	190 - 230
4.	165 - 190	230 - 265
5.	190 - 210	265 - 310
6.	210 - 235	310 - 355
7.	235 - 265	355 - 410
8.	265 - 300	410 - 490
9.	300 - 355	490 - 605
10.	355 - 455	605 - 825
11.	455 - 560	825 - 1055
12.	560 & above	1055 & above

3.8 ***Nutrients** : A wide range of nutrients are necessary to a person for performance of various bodily functions and also to lead a healthy life. The nutrients include **proteins, fat, carbohydrate, vitamins and minerals**. These nutrients are chemical ingredients which are present in the food substances. The foods containing these nutrients which we consume daily are classified as cereals, pulses, nuts & oilseeds, vegetables, fruits, milk & milk products and also foods, fleshy in nature (fish, meat & poultry).

3.8.1 * **Protein, fat and carbohydrate** are some times referred to as proximate principles. They get oxidized in the body to yield **Energy** which the body needs. Although proteins provide energy, their primary function is to provide amino acids for building body proteins. Fats, particularly the

vegetable oils, besides being a concentrated source of energy, provide essential fatty acids which perform function akin to vitamins in the body. Vitamins and minerals do not supply energy but they play an important role in the regulation of the metabolic activity in the body and help in the utilization of the proximate principles.

3.9 ***Proteins** : Proteins are one of the most important nutrient required by the body and should be available in adequate amounts in the diet. The protein needed by the body has to be supplied through the diet we consume. All foods except refined sugar, oil and fats contain protein to varying degree. Some foods contain high amount of protein and can be classified as protein rich foods. Example of such foods are animal foods like meat, fish and egg and plant foods like pulses, oil seeds and nuts. Milk also can be classified under this category if due allowance is made for large amount of water in it. These foods contain over 20% protein and soyabean is the richest source containing over 40% of protein. Cereals are moderate source of protein as they contain about 10% protein. Rice contain less protein (7%) than wheat (approx. 10%) and other cereals. Leafy vegetables, fruits, roots, tubers are generally poor sources of protein as they contain less than 2% protein. The protein values were calculated from the nitrogen contents and the factor used was 6.25 for all the food stuffs.

3.10 ***Fats** : Fat is an important component of diet and serves a number of functions in the body. Fat is a concentrated source of energy and per unit weight, it supplies more than twice the energy furnished by either of protein or carbohydrate. It also imparts palatability to a diet and retards the pace of emptying stomach. Presence of fat in the diet is important for the absorption of fat soluble vitamins like vitamin A and carotene present in the diet. Apart from these functions, some fats, particularly those derived from vegetable sources provide what is known as "essential fatty acids" (EFA) which has vitamins like functions in body. Fats in the diet can be of two kinds, the visible and invisible fat. The visible fats are those derived from animal fats like butter, ghee which are solid fats and those derived from vegetable fats like groundnut, mustard, coconut, safflower, til which are liquid fats. The invisible fats are present in other food items like cereals, pulses, oilseeds, milk, egg, meat etc. This invisible fat is believed to contribute significantly to the total fat and essential fatty acid contents of diet depending upon the nature and quantity of food stuff present in the diet. The values of fat relate to the total ether extractives and measured in gm.

* Ref: Nutritive value of Indian foods by C. Gopalan et al. National Institute of Nutrition, Hyderabad. (1978).

3.11 ***Carbohydrates** : Carbohydrates are a class of energy yielding substances which include starch, glucose, cane sugar, milk etc. Grain foods and roots & tubers are largely composed of starch, a complex carbohydrate. Food ingredients like simple sugars namely cane sugar, glucose are pure carbohydrate. Glucose derived from starch and other sugar present in the diet is the main source of energy in the body. Carbohydrates derived from cereals form chief source of energy in Indian diets.

3.12 ***Energy** : Protein, fat and carbohydrates are mainly the energy yielding components of a diet. Proteins normally supply 10-12% of energy in most diets; energy that carbohydrate and fat contribute may vary from diet to diet. It is desirable that the energy from fat should not exceed 30% and the rest may be derived from carbohydrate (60%). Quantitative food requirements are usually estimated in terms of energy. The unit of measuring energy is calories which is the amount of heat necessary to raise the temperature of one kg. of water by 1°C from 14.5°C to 15.5°C. The calorie unit of measurement of food items is 1000 times the conventional calorie unit of energy. Hence in some studies the unit of energy - nutrient notations like "kcal" (i.e. kilo calories or 1000 calories) or simple "cal" are used. Throughout this report however, only calories has been used to represent the unit of energy for nutrition which is one thousand times of a conventional calorie unit.

3.13 **Food commodities by Major Groups** : A classification of food commodities into 10 major food groups as in the table below has been framed. Energy intake is presented as a break-up over those 10 groups which usually contribute towards generation of energy in the body when consumed.

food group no.	name of the group	food group no.	name of the group
(1)	(2)	(1)	(2)
I.	Cereals	VI.	Meat, Eggs & Fish
II.	Roots and Tubers	VII.	Milk & Milk Product
III.	Sugars & Honey	VIII.	Oils & Fats
IV.	Pulses, Nuts & Oilseeds	IX.	Misc. food, Food product & Beverages
V.	Vegetables & Fruits	X.	Alcoholic Beverages

3.14 **Meal** : One or more readily eatable (generally cooked) items of food with cereal as its usual major constituent, for the purpose of consumption of a person is termed as a MEAL. Energy and other nutrients for normal living and pursuing normal vocations are provided by the meals when consumed daily once or more by a human being.

3.14.1 **Meal taken while away from home - free** : The 'meals taken while away from home' are those which are provided free by (i) employer(s) to him, (ii) schools/balwadis as mid-day meal and (iii) other households during ceremonial or other occasions to the person as guest/visitor or otherwise.

3.14.2 **Meal taken while away from home - on payment** : The 'meals taken while away from home-on payment' are those which are obtained from hotels/restaurants, eating houses etc., or from office/factory canteens by payment or on credit or purchase at subsidised rate.

3.15 **Cereal substitute** : Normally cereals are a major constituent of a person's staple diet. But at times by choice or due to reasons of scarcity, some people may not opt for much of cereals or no cereal at all. Then the cereal requirement may be made up by such consumption as of Tapioca, Mahua, Jack Fruit Seeds etc. which are cereal substitutes. However Potato or sweet potato consumed as substitute of cereals are considered as root-vegetables and not as cereal substitutes.

3.16 **"Norm" Level of Calorie Intake** : Speaking about determination of calorie requirement of a person in terms of age and/or sex is a simplification of the real situation, since the role of various other conditions such as body weight, nature of work, state of health and so on can not be overlooked as determinant cofactors. Thus requirement of calorie per consumer unit in reality is not a fixed amount but a variable depending upon all these factors. Nutritionists, attempting to assess calorie requirements per consumer unit, differ in their approaches to the problem, some specifying calorie requirement as function of body weight, while others assign requirements depending on nature of work (sedentary/moderate/heavy). From the 26th round, the NSS has been using a level to the tune of 2700 calories per consumer unit per day as a standard and measure of actual intake may be compared and contrasted with it. This level (2700 calories per consumer unit per day) is referred to & reported as the "norm" level of calorie intake. Estimates of calorie intake per consumer unit per day as percentages of this "norm" level for different categories of persons are reflected side by side for depiction of the existing situation at different levels. The

* Ref. Nutritive value of Indian foods by C. Gopalan et al. National Institute of Nutrition, Hyderabad. (1978).

eight PCU calorie intake levels created for presenting the estimates in this Report are I) < 70 II) 70 - 80 III) 80 - 90 IV) 90 - 100 V) 100 - 110 VI) 110 - 120 VII) 120 - 150 VIII) 150 & above.

3.17 Adjustment of level of calorie intake per diem per consumer unit : In the current round also, data were collected on the quantity and value of food items consumed by the households during a period of last 30 days preceding the date of enquiry. The quantity estimates of the food items consumed by a household were measured in units of calorie after application of conversion factors appropriate to the items of food. The estimates of total calorie equivalent of all food consumed by the household during the reference period is derived thus by aggregation over different groups (components) of food. Finally, the required figure on the level of calorie intake per diem per consumer unit was calculated by sub-dividing this aggregate upon the product of the number of consumer units in the household and the duration of the reference period i.e., 30.

3.18 It is to be noted that the average estimate of calorie intake per consumer unit per diem, so derived, may not necessarily represent the actual level of intake of a household. Two types of situations may happen resulting in a distorted estimate of the parameter if not adequately taken care of. Firstly, there may be members of the household who might have consumed food from their employers (without payment) or while as guests in other households or from the schools/balwadis distributed as free mid-day meals. Secondly, persons

other than the household members might have been entertained as guests during ceremonies or on any other occasions with food which though not consumed by household members, gets included in the consumer expenditure of the household. While the former is likely to raise the per capita level of calorie intake of the household, the latter will have a tendency to bring it down. Hence, to bring the estimate of calorie intake level closer to actual intake, the following adjustment procedure has been followed. Food reported to be consumed by a household may be broken up into three components viz.,

- (i) number of meals consumed by the household member in the household (M_h);
- (ii) number of meals consumed by guests (M_g),
- (iii) number of meals consumed by employees (M_e),

3.19 All these three components together account for the total reported food consumption. But, the food received free (M_f) as guest or as an employee does not enter in the reported consumption. Apart from the data on the three types of meals enumerated above, information on number of meals consumed while away from home and not included in the consumption of the household, was separately collected. With this set of information the derived level of calorie intake per diem per consumer unit for a household (C) was adjusted as (C_a) where,

$$C_a = C \frac{M_h + M_f}{M_h + M_g + M_e}$$

SECTION FOUR

SURVEY FINDINGS

4.0 Level of intake of nutrients is a variant over group or class of population and is an indicator of living standards of the agglomerate under observation. Data on HOUSEHOLD CONSUMER EXPENDITURE help in the generation of special kind of indicators helpful in assessing the quality of living standards maintained by the population belonging to different sectors and states of the country. In the present document we will concentrate on the matter revealed by the data on this aspect. Estimated values of "INTAKE OF NUTRIENTS" viz. (a) PROTEIN (b) FAT in grams c) CALORIE in Kcal. and the number of units of energy or quantity of nutrients as the case may be, derived from different food groups are presented for both RURAL and URBAN sectors of states and also for India at the beginning to start with. Distribution of households and persons by monthly per capita expenditure (MPCE) class for different calorie intake levels, worked out for each state and sector, are discussed next. Two components of the total number of meals consumed during the reference period (i) Meals taken while away from home - free of cost or on payment and (ii) meals served to guests and employees by the household have a direct effect on the estimate of calorie intake based on meals consumed at home only. An estimate closer to actual intake of calorie has been tried upon by refining the initial one by an adjustment factor; the details of the procedure of its application has also been discussed in this document. Finally the results of this round have been compared with those of earlier rounds of NSS for examination of existing trend & consistency, if any.

4.0.1 At this stage it may be mentioned that, notwithstanding the availability of survey data for all the states and union territories of the Indian union, in this document, attention has primarily been focussed on the results of 17 major states viz., 1)Andhra Pradesh, 2)Assam, 3)Bihar, 4)Gujarat, 5)Haryana, 6)Himachal Pradesh, 7)Jammu & Kashmir, 8)Karnataka, 9)Kerala, 10)Madhya Pradesh, 11)Maharashtra, 12)Orissa, 13)Punjab, 14)Rajasthan, 15)Tamil Nadu, 16)Uttar Pradesh and 17)West Bengal in the discussion made in subsequent paras on various aforesaid aspects with the aid of specially prepared statements 1-12 for the purpose. The detailed tables in respect of all the states & union territories of the Indian union are presented in Part - II.

4.1 Per capita and per consumer unit intake of calorie, protein and fat per diem by MPCE: sectoral and inter state picture.

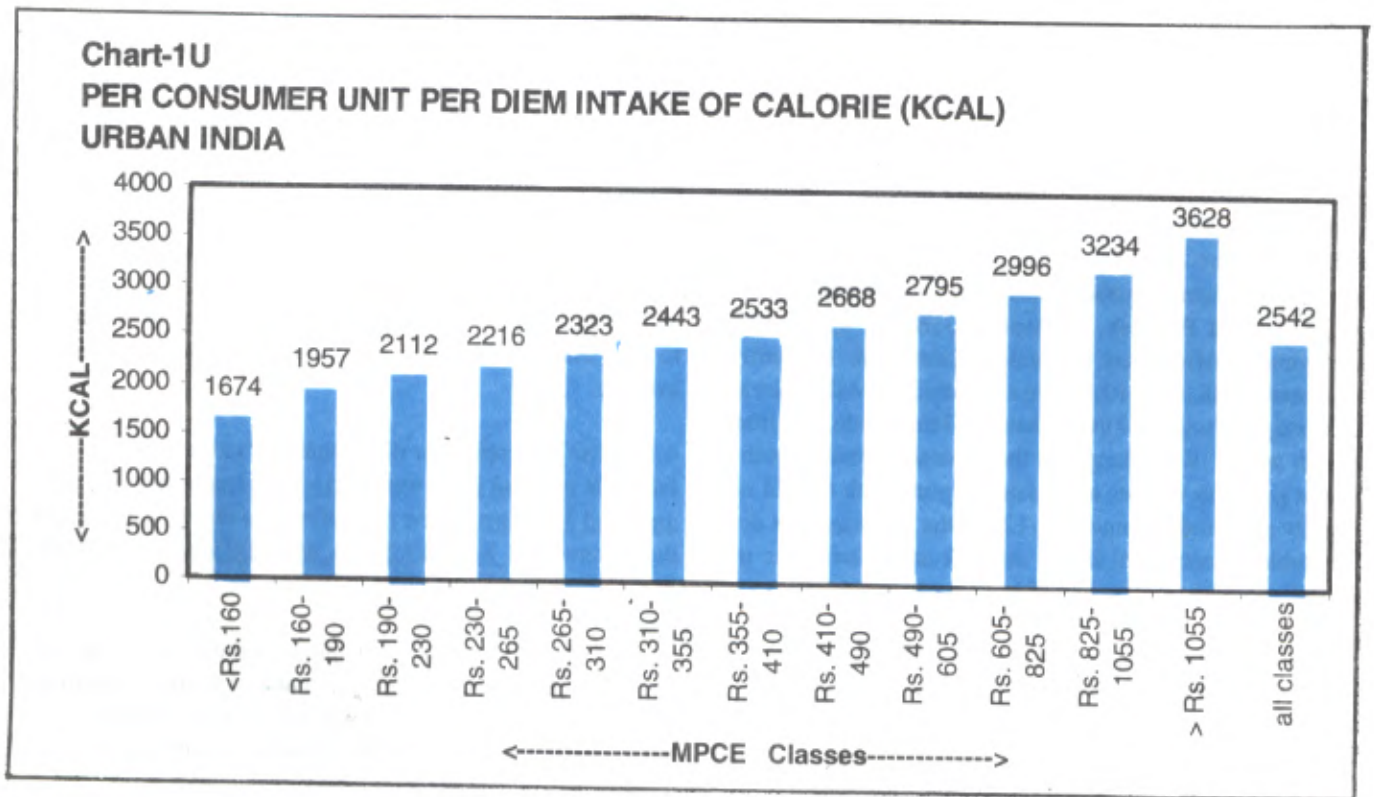

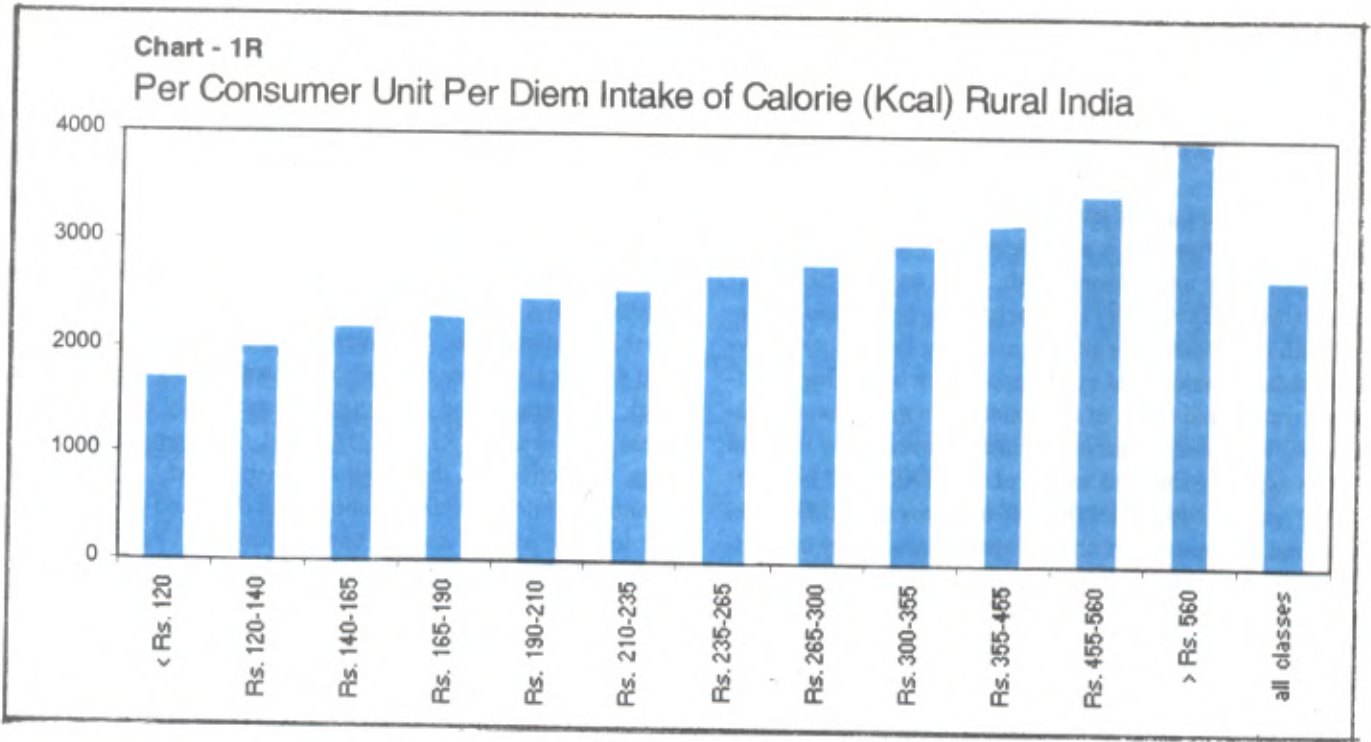

4.1.1 **Statement 1** shows per capita and per consumer unit intake of calorie, protein and fat per diem, percentage of expenditure on food to total consumer expenditure and average monthly per capita expenditure by 12 classes of MPCE for rural and urban India. The average intake of calorie, protein and fat per consumer unit per diem was found to be 2683 kcal, 75.0 grams and 39.1 grams respectively in the rural areas (see chart - 1R) and 2542 kcal, 70.2 gms. and 51.6 gms. respectively in the urban areas (see chart - 1U) of the country. While the intake of calorie was observed to be lower, the level of protein and fat consumption was considerably higher than the standard minimum requirement per diem per consumer unit in both the sectors. Moreover higher intake of calorie and protein was marked in the rural India (2683 kcal and 75.0 gms.) as compared to urban India (2542 kcal & 70.2 gms.) whereas, the consumption of fat was relatively much less in rural areas (39.1 gms.) compared to that in urban areas (51.6 gms.).

4.1.2 **Statement 2** shows per capita and per consumer unit intake of calorie, protein and fat per diem for both the rural and urban population of each state. Significant inter-state variation in the per capita and per consumer unit intake of calorie, protein and fat is observed in each of the two sectors.

4.1.3 Some states where the average intake of calorie per consumer unit per diem was predominantly higher were Jammu & Kashmir (3154), Haryana (3109), Rajasthan (3090) and Punjab (3007) in the **rural areas** and Jammu & Kashmir (2950), Himachal Pradesh (2914), Orissa(2754) and Rajasthan (2704) in the **urban areas**. On the other hand, Tamil Nadu (2347) and Assam (2406) in the **rural areas** and Tamil Nadu (2366), Maharashtra(2432), Kerala(2445) and Andhra Pradesh (2455) in the **urban areas** were found to have much lower intake of calorie than that of the Indian average.

4.1.4 The per capita per diem intake of calorie, protein and fat at the national level were 2153 Kcal (see chart- 2), 60.2 gms. and 31.4 gms. in the rural areas(see chart 2R); whereas these were 2071 Kcal, 57.2 gms. and 42.0 gms. respectively in the urban areas (see chart 2U).

4.1.5 It is seen that the per capita per diem as well as per consumer unit per diem level of intake of energy, protein & fat vary with MPCE level and was very low for those persons belonging to the lower MPCE classes and quite high for the

Chart 3R: Percentage of total intake of Calorie from Cereals (Rural India)

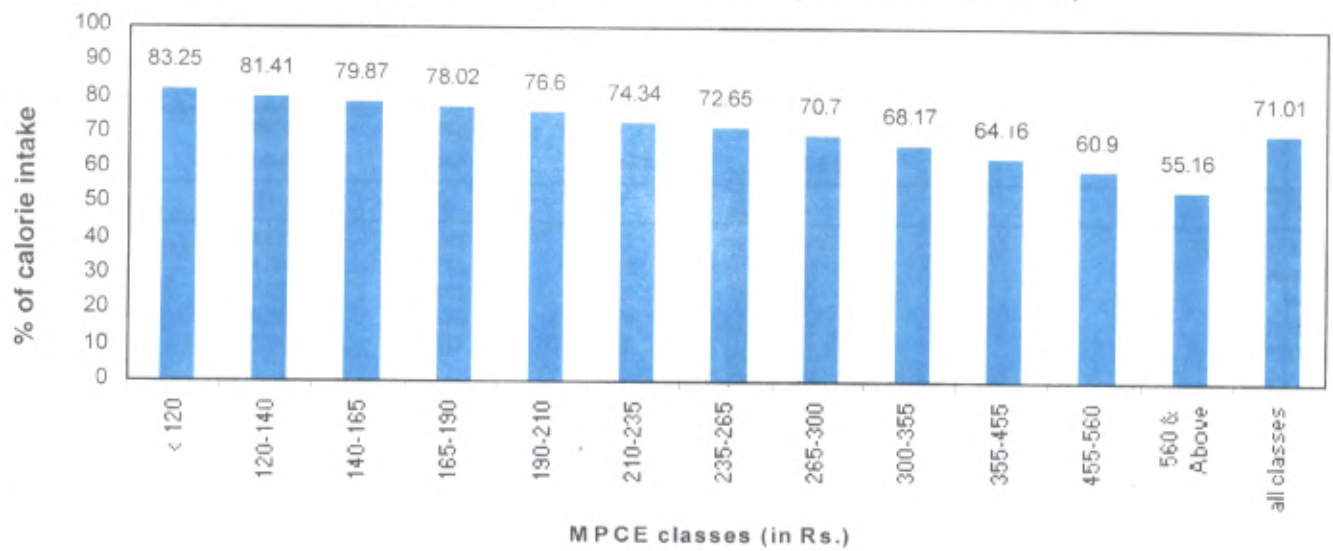

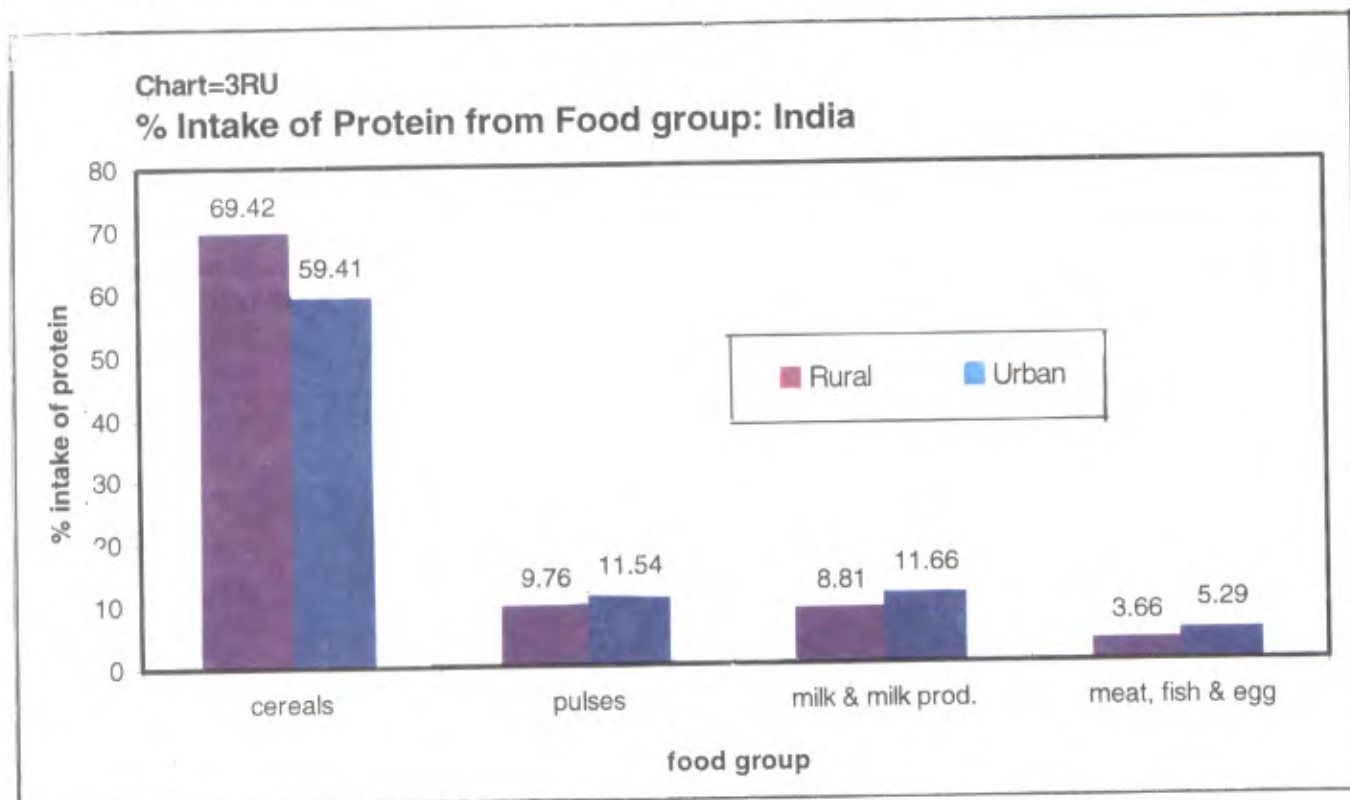

Chart 3U: Percentage of total Intake of Calorie from Cereals (Urban India)

persons belonging to the higher MPCE classes.

4.2 Percentage of total intake of calorie and protein from different groups of food items by MPCE, sectoral and inter-state comparison.

4.2.1 Looking at the percentage intake of calorie from cereals and cereal substitutes and percentage intake of protein from different items of food by monthly per capita expenditure classes for rural and urban India presented in **statement 3**, it is observed that the major part of the nutrients was derived from the cereals. At national level, out of the total calorie intake, more than 71% in the rural areas (see **chart-3R**) and 58% in urban areas (see **chart-3U**) were derived from cereals alone.

4.2.2 The average intake of protein from cereals in the country was found to be more than 69% in the rural sector and 59% in the urban sector. These proportions decline progressively with the rise of per capita expenditure level, both in rural and urban areas. However percentage of total intake of protein derived from other types of food groups showed an opposite trend, i.e., the proportions increase consistently with the rise of per capita expenditure for both the rural and urban sectors.

4.2.3 Protein as a nutrient was derived most from cereals. Pulses as a source of protein were next to the cereals in size followed by milk & milk products and meat, fish and egg in

the rural India while in the urban India, the proportion shared by the food group "milk & milk product" was largest followed by "pulses" (having marginally smaller share than "milk & milk product") and "meat, fish and egg" (see **chart-3RU**).

4.2.4 Percentage of intake of nutrients (excluding fat) from different groups of food items for all the states is shown in **statement 4** for the rural and urban sectors respectively.

4.2.5 In the rural areas, the people of Orissa (83%), West Bengal (78%) and Bihar (78%) reportedly derive around 80% of requirement of calorie from cereals. On the other hand, people of Punjab (51%), Haryana (59%) and Kerala (59%) reported to have derived lesser percentage of calorie requirement from cereals.

4.2.6 So far as the urban sector is concerned, people of Orissa (68%), Bihar (67%), Assam (66%) and Andhra Pradesh (65%) were found to have much higher intake of calorie from cereals compared to the Indian average (59%) whereas people of Punjab (49%), Gujarat (50%), Himachal Pradesh (52%) and Maharashtra (54%) reported to have got much lower intake of calorie from cereals.

4.2.7 Columns (4) to (7) of **statement 4** gives the percentage of total intake of protein from four major food groups, viz., i) cereals, ii) pulses, iii) milk & milk products and iv) meat, fish and egg. For all the states, cereals are the pri-

mary source of protein in both rural and urban areas. In the **rural areas**, pulses are the next major source of protein following cereals for Andhra Pradesh, Bihar, Karnataka, Madhya Pradesh, Maharashtra, Orissa, Tamil Nadu and Uttar Pradesh, whereas it is the major group milk and milk product which is second to cereals in this respect for Gujarat, Haryana, Himachal Pradesh, Jammu & Kashmir, Punjab and Rajasthan. The people of rural areas of Kerala and West Bengal have reportedly the major group meat, fish and egg is the source contributing towards greater proportion of total protein intake next to cereals.

4.2.8 The picture is somewhat different in case of **urban areas** so far as the proportion of intake of protein from other three sources of food than cereals is concerned. Among the states, Tamil Nadu (13%), Punjab (21%) and Kerala (21%) have reported the highest percentage of total intake of protein from pulses, milk and milk products and meat, fish and egg respectively as sources next to cereals.

4.3 Percentage distribution of calorie intake per consumer unit per diem over different food groups : inter-state comparison, sectorwise picture

4.3.1 **Statements 5R & 5U** show the distribution of intake (calorie) over nine different food groups (the details of the groups are given in Section three, para 3.13). The tenth group i.e., "Alcoholic Beverages" for which conversion factors are not readily available has not been considered for the purpose of finding out the distribution of the relevant variable.

4.3.2 **Food group I**, i.e. cereals shown in **column (3)** of statement 5 includes cereal substitutes but excludes Tapioca

(dry and green) whereas "Cereal Substitutes" given under column (3) of statement 4 includes Tapioca (dry and green). Hence the figure shown under column 3 of statement 5 will not exactly tally with that of the totals of the columns 2 and 3 of statement 4 in some of the cases. So far as the calorie intakes from the various food groups are concerned (see **chart-5 food**), the major source of energy reported by all the states in both the sectors, are cereals. While groups coming next in order of weightage to the cereals are milk & milk products (food group VII) followed by oils & fats (food group VIII) for the rural India, just opposite is the case of these two food groups for the urban India (**statement 5U**).

4.3.3 Pulses, nuts & oilseeds (food group IV) and sugar and honey (food group III) are found to be holding significant contribution (about 5-6%) to the total intake of calorie by the population of both the sectors of the country. About 29% of calorie intake is derived from food group II to IX (non-cereals) in **rural India** whereas contribution of **non-cereals** towards calorie intake is about 41% in the **urban India** (see chart 5 non-cereal). This implies that major proportion (71% in rural & 59% in urban) of calorie intake is derived from cereals both in rural and urban; consumption of food other than cereals is not much favoured by the rural households, may be due to reasons of either lack of preference for or local non-availability or non-affordability of, these items for consumption.

4.4 Distribution of household by monthly per capita expenditure (MPCE) class for each calorie intake level : sectoral, statewide and at national level.

4.4.1 It was expressed in section three that calorie intake levels have been reported as percentage of a "norm" require-

Chart-5 non-cereal:
Share in total calorie intake PUC from non-cereals : India

ment of 2700 kcal per consumer unit (hereinafter termed PCU) per diem. Eight PCU calorie intake levels have been created for presenting the estimated distributions. In the distributions of estimated persons and households by calorie intake level per consumer unit per diem, the unit of calorie intake level presented is not "calorie PCU per diem" ipso facto "percent of norm". In calorie intake level X - Y, the interpretation of X - Y in Statements 6,7,8,9,10,11 and 12, stands for a range of PCU calorie intake per diem from X % of 2700 kcal to Y % of 2700 kcal.

4.4.2 **Statement 6** shows per 1000 distribution of household by MPCE class for each calorie intake level for **rural as well as urban areas** at the national level. It may be noticed from the statement that the households with lower calorie intake level tend to be clustered in the lower MPCE classes and the households with higher calorie intake level are concentrated in the upper MPCE classes; an observation true for both the sectors. The households in the **lower Calorie intake level of 70-80** are found concentrated in the lower MPCE class of Rs.140-190 in the **Rural** areas and Rs.190-310 in the **Urban** areas whereas, households in the **higher Calorie intake level of 120-150** are found concentrated in the higher MPCE class of Rs.300 to 455 in the **Rural** areas and Rs.490-855 in the **Urban** areas.

4.4.3 Inter-state comparisons of distribution of households have been made in respect of four MPCE classes viz., less than Rs.190, Rs.190-265, Rs.265-355 and Rs.355 & above,

which have been formed by merging & regrouping certain class of MPCEs originally created, the end points of which are common to both rural and urban classes. **Statements 7R & 7U** depict the aforesaid position in the **rural and urban** respectively.

4.4.4 In the **rural sector**, examining the distribution of households in the calorie intake level of less than 70, it is found that about 91% of the households are clustered in the MPCE class of less than Rs.190 for the state of Orissa followed by smaller sizes of clustering in Bihar (89%), Madhya Pradesh (81%), West Bengal(79%) and Uttar Pradesh (77%). The picture is somewhat similar in **urban sector** but with lesser intensity: the corresponding states and size of clustering in MPCE class less than Rs 190 are: Orissa (54%), Bihar(53%), Uttar Pradesh(45%), Andhra Pradesh(37%), Madhya Pradesh(37%) and Tamil Nadu (36%).

4.4.5 In all the states, concentration of rural households, belonging to the calorie intake level of **150 and above** is maximum in the MPCE class **Rs.355 and above** in general and particularly prominent in Kerala (98%), Punjab(95%), and Haryana(93%). At the national level this figure of concentration stands at 75% of the **rural population**.

4.4.6 However the scenario is different in the **urban sector** for some states. Examining the distribution of households in the calorie intake level of **less than 70**, it was observed that the households are concentrated more in the lower two MPCE

classes viz., less than Rs.190 and Rs.190-265. 70% or more of the households are falling within these two MPCE classes in the state of Andhra Pradesh(70%), Uttar Pradesh(75%), Orissa(77%) and Bihar (84%). At the same calorie intake level, proportion of households belonging to the MPCE class of Rs.355 and above is 53% in Himachal Pradesh as against 37% in Jammu & Kashmir and 36% in Punjab.

4.4.7 In the **urban sector** for the calorie intake level of 150 and above, more than 90% of the households clustered in the MPCE class of Rs.355 and above except in Bihar(88%), Orissa(89%) and Rajasthan(88%). However at the national level, 94% of the households with 150 and above calorie intake level belong to the MPCE class of Rs.355 and above.

4.4.8 Going through the **Statement 7(R & U)** for an inter-sectoral comparison, it is marked that 69% of the rural households as against 32% of the urban for calorie intake level under 70 fall in the lowest MPCE class (<190). Further, whereas the figure of percentage in the rural sector has decreased drastically in the higher MPCE classes, the intensity of decline in percentage for the urban sector follows a smoother course and is trendy. It is interesting to note that observed number of households in the three calorie intake levels above the lowest one is consistently decreasing over MPCE classes in rural India as a contrast to the finding that figures are increasing over MPCE classes for the urban sector. Moreover this picture for the urban India is not only confined to these three calorie intake levels but also extends to all the higher calorie intake levels. In the upper most calorie intake level, out of 1000 households 940 in urban, in contrast to 751 in rural, cluster in the highest MPCE class.

4.5 Distribution of persons by monthly per capita expenditure (MPCE) class for each calorie intake level : sectoral, state and national level.

4.5.1 **Statements 8 and 9 (R&U)** show per 1000 distribution of persons by MPCE classes for each of the eight calorie intake levels in rural and urban sectors. The patterns emerging for PERSONS are almost similar to that of HOUSEHOLDS.

4.5.2 The lower MPCE classes tend to have marginally higher proportions of persons than households, a feature apparent considering the sizes of the households which almost invariably depress the PCU calorie intake level. **Statements 7R and 9R** taken together reveal that, in the Country about 69% of the rural households, accounting for 71% of the population with a calorie intake level below 70 are found to belong to the MPCE class of less than Rs.190. It is also seen that about 49% of the rural households accounting for about 53% of the population with a calorie intake level between 70 - 80 of the norm belong to the MPCE class of less than Rs.190.

4.5.3 Similarly, for the **urban India**, about 35% of the population in the lowest calorie intake level belong to the MPCE class of less than Rs.190 and the corresponding proportion of households is 32% as may be seen from **statements 9U & 7U**. For calorie intake class of "70 - 80" the proportion of population is about 13% in the MPCE class of less than Rs.190 compared to 12% in the case of households. So far as the inter-state picture of distribution of persons is concerned, **statements 9R & 9U** reveal that the distribution pattern is more or less identical with that of the distribution of households.

4.5.4 For the **lowest calorie intake level**, it is observed that 711 persons out of 1000 persons have MPCE of less than Rs.190 in the **rural India** whereas in the **urban India**, 346 out of 1000 fall in the same MPCE class. In the MPCE class Rs.190-265, the proportion is more in the **urban sector** (315 persons out of 1000 persons) than in the **rural sector** (196 persons out of 1000 persons). In the calorie level of 70-80 also, the proportion is more in the **urban sector** (262 out of 1000 against 112 out of 1000 in rural) in the MPCE class of Rs.265-355. Similar type of situation in **Urban vis-à-vis Rural** is found to exist in higher calorie intake levels also. In the **upper most calorie intake level**, 715 out of 1000 in rural belong to the highest MPCE class (i.e. 355 & above) and the corresponding ratio is 937 out of 1000 in **urban sector**. In contrast to the decreasing trend in the proportion of persons over MPCE classes in the **rural sector**, in the **urban sector** as evident from col. 10 of statement 9 (R/U) an increasing trend is observed. And finally more than 50% persons in the **urban India** belong to the upper most MPCE class, as compared to only about 20% in case of **rural India**.

4.6 Distribution of households and persons by calorie intake level for each MPCE class: National; sectoral.

4.6.1 **Statement 10** shows the per 1000 distribution of households and persons by calorie intake level for each MPCE class in both the sectors of Indian population.

4.6.2 it is observed from the statement that 37% of the rural households which accounts for 42% of the rural population receive an intake of "less than 90%" of the required level of 2700 calorie per consumer unit per diem, whereas the same level of calorie intake is reported by 42% of the Urban households which accounts for 49% of the urban population.

4.6.3 About 28% of the total population/households receive belongs to the calorie intake level of "90-110%" (2700Kcal 10% fluctuation) as evident from figures relating to all MPCE classes, for both the sectors of rural and urban. Per 1000 distribution of households and population for calorie intake level of "less than 90%" is gradually decreases with increase of MPCE classes. A reverse picture is observed in the calorie

intake level of 110% & above. This phenomenon is observed for both the sectors of rural and urban.

4.6.4 It is seen that the number of persons in higher intake levels is less than the corresponding number of households, the reverse phenomenon is noticed in lower calorie intake level, which is expected.

4.7 Number of Meals Consumed Per Household at Home, Away from Home - Free/On Payment and Number of Meals Consumed Per Thousand Households by Guests & Non-member Employees : Inter-state, Sectoral Situation.

4.7.1 In **statement 11** data on average number of meals consumed per household at home and while away from home along with average no. of meals consumed per thousand households by guests and non-member employees has been given statewise for both the sectors of Indian population.

4.7.2 In the **rural sector** it was observed that total number of meals consumed per household during the reference period varies in the range 327 in Gujarat to 469 in Jammu & Kashmir whereas the corresponding **national** figure is 357. It is also noticed that more than 400 meals per household in the reference period are consumed in the states of Jammu & Kashmir(469), Punjab(452), Haryana(420), whereas less than 335 meals per household during the reference period are con-

sumed in the states of Bihar(332), West Bengal(330) and Gujarat. The states where the consumption of meals per household in the reference period is of the order of **National standard** are Assam (356), Madhya Pradesh(353), Andhra Pradesh(349), Himachal Pradesh(348) and to a lesser extent in Orissa (367), and Uttar Pradesh (368).

4.7.3 It is also noticed that the total number of meals consumed in the reference period per capita in **rural India** stands at around 73. The corresponding state averages vary in the range 65(Gujarat) to 87(Punjab). In terms of per capita consumption of meals, the top 5 states are Punjab(87), Tamil Nadu(86), Andhra Pradesh(84), Kerala(83), Jammu & Kashmir(83) whereas the bottommost 3 states are Gujarat(65), West Bengal(66) and Bihar(67).

4.7.4 In the **rural sector**, it is marked that in most of the states around 95% of the total meals are taken at home by the household. Among the states, in Kerala more than 3% and in Tamil Nadu more than 5% of the meals are consumed by the household members while away from home. In the remaining states the percentage of meals taken while away from home is less than or equal to 2. It is found that in almost all the states except in Kerala and Tamilnadu less than 0.5% of meals consumed are on payment while away from home.

STATEMENT - 12 : PERCENTAGE OF HOUSEHOLDS WITH PER CONSUMER UNIT PER DIEM CALORIE INTAKE LEVEL OF 90% TO 100% AND 100% TO 110% OF NORMAL REQUIREMENT (2700 KCAL) WHICH MOVED UPWARD, MOVED DOWNWARD AND REMAINED IN THE SAME LEVEL AFTER ADJUSTMENT

Chart-12 Fat: Per capita intake of Fat over two decades (1972-94) in India

4.7.5 In the **urban sector** average number of meals consumed by the household during the reference period stands at 312 at the **National level** and the corresponding figure is derived to be at around 70 per person. Whereas around 96% of the meals are consumed at home, the rest i.e. 4% is consumed by the members while away from home (see chart-10). Average number of meals consumed by urban households varies in the range 247 (both Himachal Pradesh & West Bengal) to 388 (Punjab). Lower consumption of meals per household is observed in the states of Gujarat(282), Maharashtra(286) and Assam(295). Highest consumption of total meals per household is observed in the states of Punjab followed by Jammu & Kashmir(383), Kerala(354) and Uttar Pradesh(348).

4.7.6 Total number of meals consumed per capita, in the **urban sector**, varies in the range 61(West Bengal) to 87 (Punjab). It is also marked that 5% or more of meals are consumed while away from home by the household members in the states of Himachal Pradesh (8%), Kerala(5%) and Tamil Nadu(7%). It is also found that in the states of Tamil Nadu, Kerala and Himachal Pradesh maximum number of meals per capita are taken while away from home by the household members, a factor explainable possibly by extent of urbanisation and other social factors like easy and convenient availability of free meals from sources enumerated. It is also noticed that relatively more meals consumed while away from home during the reference period of 30 days, are on payment in the states of Himachal Pradesh(11) and Kerala(9) when seen against the corresponding all-India average of 4.

4.7.7 **Statement II** showing average no. of meals consumed by guests and non-member employees also reveals that at the all India level around 3.3 meals per households are consumed by non-household members in the rural India and around 1.9 meals per household are consumed by them in the urban India, during the reference period of 30 days. This amounts to around 0.1 meals per household per day in the rural & even less than that, in the urban areas. The effect of this component in the study of calorie intake level per consumer unit per diem has been appropriately taken into account for the subsequent analysis. The percentage shares of consumption by guests and employees is pictorially shown in chart 10R & 10U.

4.7.8 It is observed that share of **non-member employees** in the number of meals consumed is 5% in **both the sectors** but the share of consumption of **guests** during ceremony is **more in Rural** than in **Urban** areas.

4.8 Effect of adjustments at different calorie intake levels : sectoral, inter-states and national level picture.

4.8.1 The scenario of intake of calorie per diem per consumer unit at any particular level may get slightly changed when observed in the overall perspective considering the factors viz., consumption of **free meals** etc. by **household members or guests**, that influence the level to an extent. Adopting the procedure elaborated in para 3.17 & 3.18, to take care of this aspect, it is seen that the percentage of house-

holds found to be i) remaining in the same category, (ii) moving downward, (iii) moving upward after adjustment in two ranges (representing "norm" level) of reported calorie intake level are as shown in **statement 12**.

4.8.2 In the **rural sector** for the **range 90-100**, **more than 85%** of the household remained in the same class after adjustment in most of the states except in Uttar Pradesh, Gujarat and Himachal Pradesh. In the process of adjustment, **upgradation** in calorie intake level of even **5%** of households to upper class has been found in none of the states, whereas **degeneration** of $\geq 10\%$ of households to lower level has been noticed in Punjab (12), Uttar Pradesh(16), West Bengal(10), Andhra Pradesh(12), Gujarat(16), Karnataka(12), Maharashtra(14), Himachal Pradesh(18) and Rajasthan(11). **Maximum degradation** in calorie intake level of household to lower category has been marked in the states of Himachal Pradesh (18), Gujarat (16) & Uttar Pradesh (16) whereas **maximum upgradation** to the tune of **3%** or less of households is noticed in a few states like Kerala (3) and in Andhra Pradesh, Gujarat, J & K, Tamil Nadu and Uttar Pradesh (2 each).

4.8.3. At the **National level** in the **rural sector** it is noticed that in the **90-100 level** of calorie intake, around **88%** of the household remained intact at the same level & whereas more than **10%** of households have been found to **recede to lower level**, a little more than **1%** go to the upper echelon after adjustment. Identically similar situation is also observed in the next i.e., **100-110 level** of calorie intake.

4.8.4 It is seen that, **more than 85%** of the households remain in the same category after adjustment, in the 90-100 range in the **urban sector** of different states except for Andhra Pradesh and Himachal Pradesh. In the other range i.e. **100-110** also **more than 85%** of the households remain in the same category after adjustment, in **urban sector** of most of the states except for Andhra Pradesh, Gujarat, Himachal Pradesh and Tamil Nadu. For the **Country**, movement of households to lower calorie intake level is prominent than the same to upper levels in both the ranges considered, whereas around **90%** of the households remain intact in the same level even after going through the necessary process of adjustment to examine the resultant effect on estimate originally derived.

4.8.5 In **90-100 range**, in the case of urban sector, movement of **10%** or more of households to lower level has been observed in the state of Andhra Pradesh, Gujarat, Jammu & Kashmir, Maharashtra and Punjab, whereas movement of **10%** or more of households to upper level has been observed only in the state of Himachal Pradesh.

4.9 **Observed trend in per capita intake of Nutrients per diem over the last two decades (1972-73 to 1993-94): NSS**

27th, 38th and 50th round results.

4.9.1 As mentioned at the beginning, data relating to **17 major states** of India viz. 1)Andhra Pradesh, 2)Assam, 3)Bihar, 4)Gujarat, 5)Haryana, 6)Himachal Pradesh, 7)Jammu & Kashmir, 8)Karnataka, 9)Kerala, 10)Madhya Pradesh, 11)Maharashtra, 12) Orissa, 13)Punjab, 14)Rajasthan, 15)Tamil Nadu, 16)Uttar Pradesh and 17)West Bengal have been examined and compared to study the existence of trend, if any.

4.9.2 **Statement 13** shows the average per capita per diem intake of calorie, protein and fat for the aforementioned states and the national average according to successive NSS rounds for both the rural and urban sectors. Columns(2), (3) & (4) indicate the average intake of calorie during 1972-73, 1983 and 1993-94, which reveal that at the national level, the intake was **reduced** by about **45 kcal** during **1972-73 to 1983** and **further gone down** by **68 kcal** during 1983 to 1993-94 in the **rural areas** whereas the decrease is marginal in the case of **urban areas** (18 kcal each in two consecutive periods from 1972-73 to 1983 and 1983 - 1993-94) (see chart-12cal). State level estimates also show a trend similar to the national average. The intake of calorie has gone down over the two decades for most of the states except in **both sectors of Kerala & West Bengal** and **rural sector of Orissa and urban sector of Bihar, Karnataka, Maharashtra and Tamil Nadu**.

4.9.3 Per capita per diem intake of protein has been compared under columns (5), (6) and (7) and it may be seen that at the **national level**, the average intake remains the same at **62.0 gms** over the period from 1972-73 to 1983 but **decreased** by about **2 gms**, during 1993-94 for the **rural sector** whereas the average intake of protein in **urban India** was increases by **one gm** from 1972-73 to 1983 and remains at the **same level** in the year 1993-94. At the state level, the intake of protein does not show any trend. It is found that the intake increases from 1972-73 to 1983 and then **decreases** in 1993-94 for **rural areas** in the states of Andhra Pradesh, Gujarat, Karnataka and Maharashtra whereas the trend is just the opposite in respect of Haryana, Jammu & Kashmir, and Rajasthan. The states where the protein intake is constantly on the **decline** are Assam, Himachal Pradesh, Punjab, Tamil Nadu and Uttar Pradesh. A constant increase is observed only in **three coastal states** viz. Kerala, Orissa and West Bengal.

4.9.4 In the **urban sector**, the trend in people's protein intake is mixed but with a different dimension. For Assam, Jammu & Kashmir and West Bengal per capita protein intake is found to have been **reduced** during 1972-73 to 1983 but **increased** in 1993-94. In Karnataka, Madhya Pradesh and Maharashtra the pattern is exactly the opposite. The intake of protein is **consistently going up** in Bihar, Kerala,

Orissa, Tamil Nadu and Uttar Pradesh and for the rest of the states in **urban sector**, it is found to have **gone down** during the period 1972-73 to 1993-94. However, in **urban India** the intake of protein per capita remains **almost static** throughout the entire period under review (see chart-12pro)

4.9.5 So far as the intake of fat over successive NSS rounds (see chart-12fat) is concerned, it has been found to be **increasing** in almost all the states as well as at the national level in **both the sectors**, barring rural areas of Himachal Pradesh and urban areas of Gujarat and Himachal Pradesh. At the national level, the quantum of increase registered is higher during 1983 to 1993-94 as compared to the period from 1972-73 to 1983. It is interesting to note that in **urban areas** people's intake of fat is significantly more than that in **rural areas** despite awareness about health care, may be due to reasons of easy availability, affordability and preference for processed food containing larger fat component.

4.10 Observed trend in the distribution of households and persons by level of Calorie Intake over decade (1983 to 1993-94) : NSS 38th and 50th rounds results.

4.10.1 **Statement 14** shows per thousand distribution of households by **calorie intake level** in both rural and urban sectors for each of the 17 major states and National average according to **successive NSS rounds** [38th (1983) and 50th (1993-94)].

4.10.2 While comparing the estimates, the calorie intake levels have been classified into three major groups, viz. (i) **Norm level** of calorie intake, with $\pm 10\%$ fluctuation (90% to 110% of 2700 kcal), (ii) **below Norm** (less than 90%) and (iii) **above Norm** (110% & above).

4.10.3 It is observed that the proportion of households belonging to the calorie intake level "**below Norm**" has decreased by 7 and 23 out of every 1000 during 1983 to 1993-94 for the rural and urban sectors respectively at the national level.

4.10.4 The proportion of households in the "**Norm level**" of calorie intake has been increased by 39 and 24 out of every thousand in the rural and urban sectors respectively at the national level, during 1983 to 1993-94.

4.10.5 In the "**above Norm**" calorie intake level the proportion of households has remained unchanged over the decade in the urban sector whereas it has decreased by 31 out of every 1000 in the rural sector at the national level.

4.10.6 While comparing among the major states by NSS rounds, it seems that in rural sector, the proportion of households in "**below Norm**" calorie intake level has decreased during 1983 to 1993-94 in the states of Himachal Pradesh, Jammu & Kashmir, Kerala, Orissa, Rajasthan, Tamil Nadu, Uttar Pradesh and West Bengal whereas the number has increased in the rest of the states. On the other hand, in urban sector, the number has increased only in the states of Andhra Pradesh, Haryana, Karnataka, Madhya Pradesh and Punjab.

4.10.7 In the "**Norm level**" of calorie intake, the proportion of households has increased over decade in both the sectors in all the states except only in Orissa where the number has gone down.

4.10.8 The proportion of households belonging to the "**above Norm**" calorie intake level has decreased in most of the states of rural sector except Orissa, Rajasthan and West Bengal. However, in the urban sector, the proportion has increased over the decade in about half of the major states and in the rest half, it has decreased.

4.10.9 Per 1000 distribution of persons by calorie intake level (Norm level, below Norm and above Norm) in both rural and urban sectors for each of the 17 major states by two successive NSS rounds (38th and 50th) are presented in **Statement 15**.

4.10.10 The proportion of population belonging to the "**Norm level**" of calorie intake, with $\pm 10\%$ fluctuation, has increased over decade (1983 - 1993) by 42 and 30 out of every thousand in rural and urban sector respectively at the national level. While comparing the figures among the states by NSS rounds, it is found that the trend is in the similar nature to that of the national average except for Gujarat and Maharashtra in rural sector and only Orissa in urban sector where the proportion has decreased during 1983 to 1993-94.

A Note on Comes of Household Income in India NSS 50th Round (July 1993 to June 1994)

SECTION I

Introduction

During its 5th quinquennial survey of household consumer expenditure and employment-unemployment (1993-94), the National Sample Survey Organisation collected some information on sources of income of rural and urban households throughout the country. The results are presented in this document. The survey (NSS 50th round) was conducted in 115354 households located in 6951 villages and 4650 urban blocks. This document is one the six of document through which the findings of the survey are being released.

The National Sample Survey was set up in 1950, with the idea of having a permanent survey organisation to collect data on various facets of the economy through nationwide sample surveys in order to assist in socio-economic planning and policy making. The NSS is a continuing survey in the sense that it is carried out in the form of successive "rounds", each round usually of a year's duration covering several topics of current interest in a specific survey period. At present each NSS round reaches, at the all-India level, about 12,000 to 14,000 villages and blocks in the Central sample (covered by the Central agency NSSO) and an independent sample of about 14,000 to 16,000 villages and blocks in the State sample (covered by the Governments of various states and union territories). The entire area of the country - rural and urban - is covered, with the exception of some interior areas of Nagaland and Andaman & Nicobar Islands, and Ladakh and Kargil districts of Jammu & Kashmir. In the 50th round, certain other districts of Jammu & Kashmir, viz. Doda, Anantnag, Pulwama, Srinagar, Badgam, Baramula and Kupwara, and Punjab's Amritsar district, had to be excluded from the survey due to unfavourable field conditions.

Quantitative data on household income are at present not collected in NSS household surveys because of the difficulty of getting reliable data on the subject through direct enquiries. However, no obstacles are encountered in ascertaining *whether or not* a sample household received any income during last year from cultivation, wage/salaried employment, pension, etc.

Such information, though admittedly ineffective in gauging the extent of dependence of the population on particular sources of income, can give a reasonably good idea of differences in the sources of income earned in different regions of the country. If collected at regular intervals, it can also indicate trends in the pattern of income receipts over time. Because of the readiness with which households provide such data and the non-existence of measurement problems, estimates of proportions of households earning income from each source are presumed to be free from non-sampling errors to a large extent.

Income sources can be classified into income accruing from economic activity and income accruing otherwise. The latter includes income from rent, pension, remittances, interest and dividends. Economic activity includes wage/ salaried employment (regular or casual) and income from enterprise. The eight sources considered in this survey were: wage/ salaried employment, three types of enterprise income coming from cultivation, fishing or other agricultural enterprise, and non-agricultural enterprise respectively - pension, remittances, interest and dividends, and "other sources".

Households were also classified by the survey into four or five occupational types and three social groups, and estimates of proportion of households receiving income from any source were generated separately for each combination of occupational type and social group.

Unpublished data on the same subject collected through the same approach in the previous quinquennial survey of NSSO on consumer expenditure and employment-unemployment (1987-88) have been shown in some of the text tables for purposes of comparison.

Detailed tables at state/u.t. level are provided in the Part-II.

SECTION 2

Sample design

Sample Design : A stratified two-stage sampling design was adopted, with census villages as first stage units (fsu's) in the rural sector and Urban Frame Survey (UFS) blocks in the urban, except for a few newly declared towns of the 1991 census, for which UFS frames were not available, and census enumeration blocks (EB's) were used as first stage units. Households formed the second stage units in both rural and urban sectors.

The survey period of one year was divided into four **sub-rounds** of three months each and equal numbers of sample villages and blocks allotted to each sub-round.

	1	July - Sept 1993
sub-	2	Oct - Dec 1993
rounds	3	Jan - Mar 1994
	4	Apr - June 1994

Sampling frame for fsu's : In the rural sector, the sampling frame was provided sometimes by the 1981 census list of villages and sometimes by the 1991 census list of villages, depending on the sub-round (see para 2.1) and the state/union territory being surveyed, as follows.

In the following areas of rural India (hereafter referred to as **Group A areas**), the 1981 census lists of villages served as the sampling frame for **all 4 sub-rounds** :

Jammu & Kashmir - where the 1991 census was not conducted.

Agra district of U.P. and Durg, Sagar and Morena districts of M.P. - for which the available information for 1991 was incomplete.

In the following areas of rural India (hereafter referred to as **Group B areas**), the 1991 census lists of villages served as the sampling frame for **all 4 sub-rounds** :

Andhra Pradesh, Assam, Kerala, Orissa, W. Bengal & Chandigarh.

U.P. and M.P. (excepting Group A areas).

In the remaining states/u.t.'s of rural India (hereafter referred to as **Group C areas**), the 1981 census lists of villages were used as sampling frame for **sub-round 1** and the 1991 census lists used for **sub-rounds 2 to 4** in order to make use of the latest available information in the sample selection process.

For Nagaland, the villages situated within 5 km of a bus route constituted the sampling frame. For the Andaman & Nicobar Islands, the villages which remain inaccessible throughout the year were, as usual, excluded from the sampling frame.

In the urban sector, the lists of NSS Urban Frame Survey (UFS) blocks were the sampling frames used in most cases. However, 1991 census house listing enumeration blocks were considered as the sampling units for some of the newly declared towns of the 1991 population census, for which UFS frames were not available.

Stratification : As usual, each state/union territory (u.t.) was divided into one or more agro-economic regions by grouping contiguous districts which are similar with respect to population density and crop pattern. In Gujarat, however, some districts were sub-divided for the purpose of region formation on the basis of location of dry areas and the distribution of tribal population in the state. The total number of regions formed in the whole of India was 78.

In the rural sector, within each region, each district normally formed a separate stratum. However, if the census population of the district according to the sampling frame used exceeded 1.8 million / 2 million (depending on whether 1981 or 1991 census frame was used), the district was split into two or more strata by grouping contiguous tehsils. In Gujarat, however, in the case of districts extending over more than one region, the portion of a district falling in each region constituted a separate stratum even if the rural population of the district as a whole was less than 1.8 million / 2 million.

In the urban sector, strata were formed, again within NSS regions, on the basis of town population. In order to be able to allocate a larger proportion of the sample to the affluent section of society and thus improve the precision of the overall estimate of consumer expenditure, the usual first-stage stratification procedure was modified as follows. Urban blocks in towns with census population 400,000 or more were placed

in different strata depending on whether they belonged to the "affluent" area of the town or not - the information on affluent areas being supplied by the regional/sub-regional field offices of NSSO. Full details of urban stratification are given below.

stratum	composition
1	towns with population less than 50,000
2	towns with population 50,000 - 199,999
3	towns with population 200,000 - 399,999
4	towns with population 400,000 - 999,999 - affluent areas
5	towns with population 400,000 - 999,999 - other areas
6	a single city (if any) with population 1 million or more - affluent areas
7	a single city (if any) with population 1 million or more - other areas
8	another city (if any) with population 1 million or more - affluent areas
9	another city (if any) with population 1 million or more - other areas

Following usual NSS practice, the sample of villages and blocks in which the enquiry was carried out was drawn in the form of two independent **sub-samples**. Either of these sub-samples could be used to generate a valid set of estimates which might be regarded as the provisional results of the survey until such time as the final results, based on the entire sample, were available.

Allocation of sample: The first-stage sample size for any state/union territory of India was determined on the basis of its investigator strength and the expected workload per investigator. This sample was first allotted to the rural and urban sectors in consideration of the relative sizes of the rural and urban population with double weightage to the urban sector.

Within the **urban** sector of a state/u.t., allocation of the sample to the different urban strata was done in proportion to stratum population with double weightage to affluent strata - that is, strata 4, 6 & 8 (see para 2.3.2). Stratum level allocations were adjusted to multiples of 8 as far as possible so as to have equal allocations for each sub-sample-sub-round combination.

Within the **rural** sector of a state/u.t., allocation of the sample to the different rural strata was done as follows.

For Group B areas (see para 2.2), the state/u.t. level rural sample was allocated to the different rural strata in proportion to 1991 census population. For other areas (Group A and Group C), allocation was initially made on the basis of 1981 census population. Stratum level allocations were adjusted to multiples of 8 as far as possible so as to have equal allocations for each sub-sample-sub-round combination.

However, for Group C areas, the original allocations for sub-rounds 2 to 4 were revised as follows. The total state/u.t. level allocation for sub-rounds 2 to 4 combined - 75% of the total as 25% had gone to sub-round 1 - was re-allocated to the rural strata in proportion to stratum population as per 1991 census. Stratum level allocations were adjusted to multiples of 6 as far as possible so as to have equal allocations for the remaining sub-sample-sub-round combinations.

Selection of fsu's : Sample villages - except in Arunachal Pradesh - were selected by PPS circular systematic sampling (with population as the size variable) from the appropriate sampling frame as explained in para 2.2, in the form of two independent **sub-samples**. Sample blocks were selected by ordinary (equal probability) circular systematic sampling, also in the form of two independent sub-samples.

In Arunachal Pradesh the sample of villages was drawn by a cluster sampling procedure. The field staff were supplied with a list of sample "nucleus" villages and were advised to select clusters of villages - building up each cluster around a nucleus village - according to prescribed guidelines. The nucleus villages were selected circular systematically with equal probability, in the form of two independent sub-samples.

Selection of hamlet-groups/sub-blocks : To reduce workload the following procedure was adopted in drawing up the second-stage sampling frame. Larger sample villages and blocks were divided - according to usual NSS practice - into a suitable number of "hamlet-groups"/ "sub-blocks" of roughly equal population content : the second-stage sampling frame was constituted of the households belonging to only two of these hamlet-groups, selected circular systematically, in case of sample villages, and one randomly selected sub-block in case of sample blocks (instead of the whole village/block). No hamlet-group formation was, however, done in Arunachal Pradesh. In Kerala, practical difficulties arose in hamlet-group formation during sub-round 1. These were resolved by selecting, instead of two hamlet-groups, two EB's from the constituent EB's of large villages.

Selection of households : The affluent classes of society have expenditure levels spread over a very wide section of the consumer expenditure range. As a result, the contribution of these classes to the sampling error of a consumer expenditure survey is large compared to that of an equal-sized chunk of

population belonging to the more homogeneous "middle classes". To improve the efficiency of consumer expenditure estimates, it was decided that the second-stage sampling frames ought to be stratified in such a way as to be able to allocate a larger proportion of the sample to the affluent sections of the population wherever they could be located.

Rural : In sample villages, households in the second-stage sampling frame were divided into two strata as follows. Households - if any - exhibiting signs of affluence such as the possession of any of a specified list of assets including land in excess of a certain specified area, or a member holding a good salaried job or belonging to a paying profession such as that of a doctor or advocate, were designated "affluent households" and the top 10 such households (subject to availability) placed in stratum 1. The remaining households formed second-stage stratum 2. **Two** households were selected circularly systematically from second-stage stratum 1. From second-stage stratum 2, **eight** households were selected circularly systematically after arranging the households in the stratum by "means of livelihood" ; this meant that households "self-employed in agriculture" were placed first, followed by "rural labour" households, and then the "others". Further, the households under "others" were arranged in five different land-possessed classes to ensure spread of the sample over households of different economic statuses.

Urban : In sample blocks, households with monthly per capita consumer expenditure (as reported at the time of household listing) Rs. 1200 or more (Rs. 1500 or more in towns with population one million and above) were placed in second-stage stratum 1 and the rest in second-stage stratum 2. In sample blocks belonging to first-stage strata 4,6 & 8 (affluent areas of towns with population 4 lakhs or more), as many as **four** sample households were selected for survey from second-stage stratum 1 and **six** from second-stage stratum 2. In all strata other than those numbered 4,6 & 8, **two** sample households were selected from second-stage stratum 1 and **eight** from second-stage stratum 2. In each case the sample of households, for each second-stage stratum, was drawn circularly systematically with a random start. The households in second-stage stratum 2 were, prior to sample selection, placed in eight different groups and the different groups of households placed one after another in a specified order to ensure spread of the sample over the different groups. The grouping was done on considerations of means of livelihood (self-employed / regular wage or salary earning / casual labour / others) and household monthly per capita consumer expenditure.

Sample size : The survey covered, in all, 115354 households spread over 11601 sample villages/blocks. The number of sample villages and blocks allotted and surveyed, and the number of sample households and persons surveyed, are given for different state/u.t.'s and all-India in Table T0, separately

for rural and urban sectors.

Estimation Procedure

Estimation of aggregates at sub-sample level : Aggregates are first estimated at sub-sample level according to the following estimation formulae, where \hat{Y} denotes the estimate - based on one sub-sample - of the aggregate of a given characteristic Y for a sector of a state/u.t.

For the rural sector of state/u.t. other than Arunachal Pradesh,

$$\hat{Y} = \sum_s \frac{1}{n_s} \sum_t \frac{P_{st} D_{st}^*}{P_{st}} \sum_{i=1}^2 \frac{H_{sit}}{h_{sit}} \sum_{j=1}^{h_{sit}} y_{sitj}$$

For the rural sector of Arunachal Pradesh,

$$\hat{Y} = \sum_s \frac{1}{n_s} \sum_{i=1}^{n_s} N_{si} \sum_{i=1}^2 \frac{H_{sit}}{h_{sit}} \sum_{j=1}^{h_{sit}} y_{sitj}$$

For the urban sector of a state/u.t.,

$$\hat{Y} = \sum_s \frac{N_s}{n_s} \sum_{i=1}^{n_s} D_{si} \sum_{i=1}^2 \frac{H_{sit}}{h_{sit}} \sum_{j=1}^{h_{sit}} y_{sitj}$$

where

- Y : observed value of the same characteristic in a sample household
- s : stratum suffix
- t : second-stage stratum suffix
- i : sample village/block suffix
- j : sample household suffix
- D : number of hamlet-groups/sub-blocks formed in the surveyed village/block
- H : number of households listed in the second-stage sampling frame
- h : number of sample households surveyed
- p : population of sample village as in the sampling frame
- N : for the urban sector, number of blocks in the sampling frame
- n : number of sample villages/blocks surveyed in this sub-sample
- P_{st} : population of the s-th stratum as per frame used in the selection of i-th sample village of the stratum
- N_{si} : for Arunachal Pradesh, number of sample villages in the sampling frame for s-th stratum

which was used in selection of i-th sample village of the stratum

D^* : equals 1, if $D = 1$
equals $D/2$ if $D > 1$.

2.10.2 Estimation of aggregates for the combined sample (pooling sub-samples) : The combined sample estimate of an aggregate is obtained as the simple average of the corresponding sub-sample estimates.

Estimates of ratios : The estimate of a ratio of the form $R = Y/X$, where Y and X are the population aggregates of two characters, is obtained as

$$\hat{R} = \frac{\hat{Y}}{\hat{X}}$$

where \hat{Y} and \hat{X} are estimates of Y and X obtained according to the procedure laid down in paras 2.10.1 and 2.10.2. Examples of ratio estimates are rates and percentages.

TABLE T0: NUMBER OF VILLAGES/BLOCKS ALLOTTED AND SURVEYED AND NUMBER OF SAMPLE HOUSEHOLDS AND PERSONS SURVEYED

SECTION 3

Concepts and Definitions

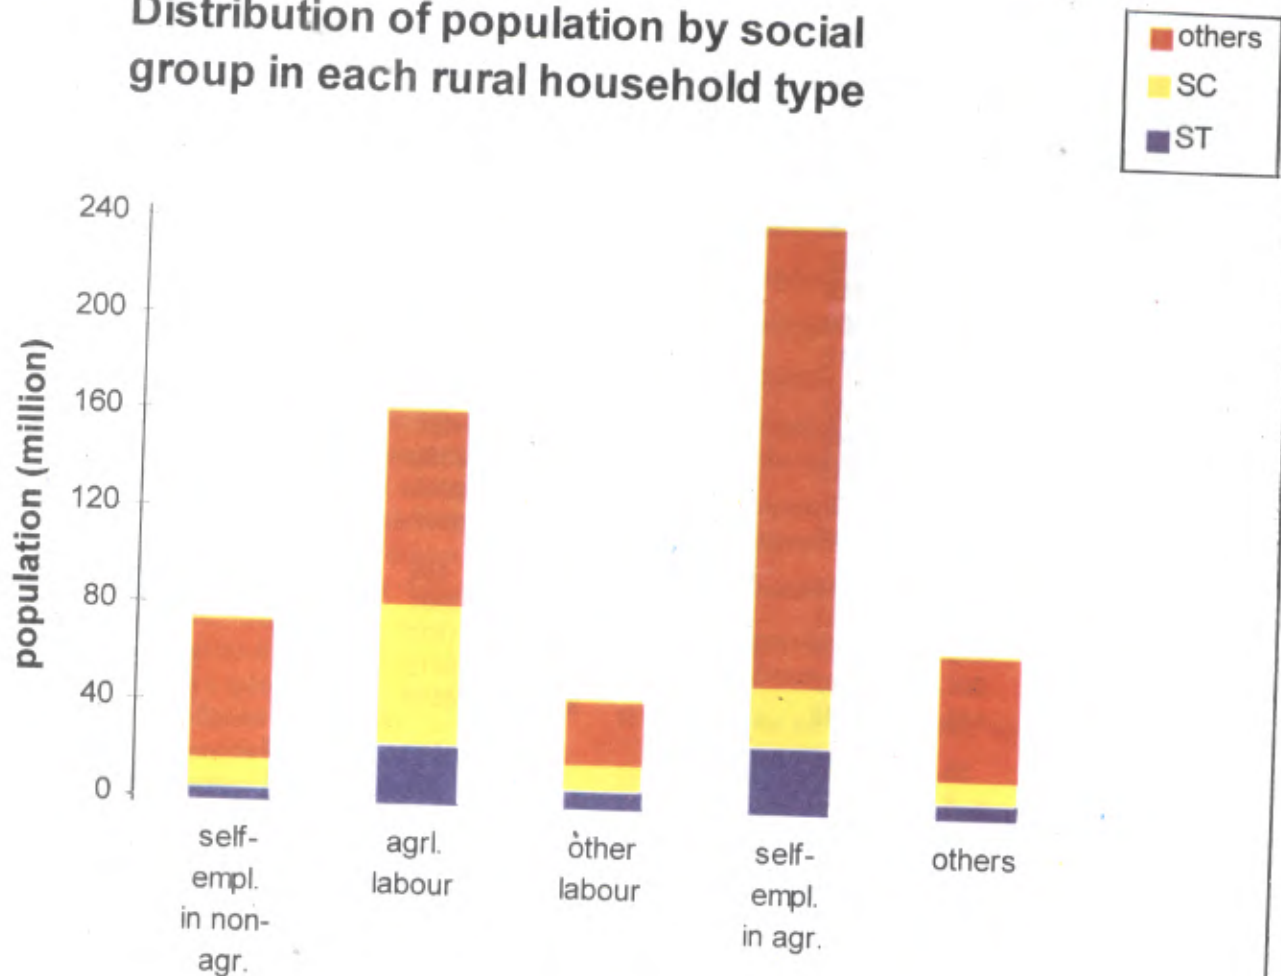

Household : A group of persons normally living together and taking food from a common kitchen constitutes a household. The word "normally" means that temporary visitors are excluded but temporary stay-aways are included. Thus a son or daughter residing in a hostel for studies is excluded from the household of his/her parents, but a resident employee or resident domestic servant or paying guest (but not just a tenant in the house) is included in the employer/host's household. "Living together" is usually given more importance than "sharing food from a common kitchen" in drawing the boundaries of a household in case the two criteria are in conflict; however, in the special case of a person taking food

with his family but sleeping elsewhere (say in a shop or a different house) due to space shortage, the household formed by such a person's family members is taken to include the person also. Each inmate of a mess, hotel, boarding and lodging house, hostel, etc. is considered as a single-member household except that a family living in a hotel (say) is considered as one household only; the same applies to residential staff of such establishments.

Major states : This refers to the following states of India: Andhra Pradesh, Assam, Bihar, Gujarat, Haryana, Karnataka, Kerala, Madhya Pradesh, Maharashtra, Orissa, Punjab,

Figure 1

Distribution of population by social group in each rural household type

Rajasthan, Tamil Nadu, Uttar Pradesh and West Bengal.

Household type: Rural households were classified into five types and urban households into four types on the basis of the occupations pursued by the household type members. The five types of rural households are *self-employed in non-agriculture, agricultural labour, other labour, self-employed in agriculture, and other households*. The four types of urban households are: *self-employed, regular wage / salary earner, casual labour, and other households*.

The "type" of a household was determined as follows.

Rural

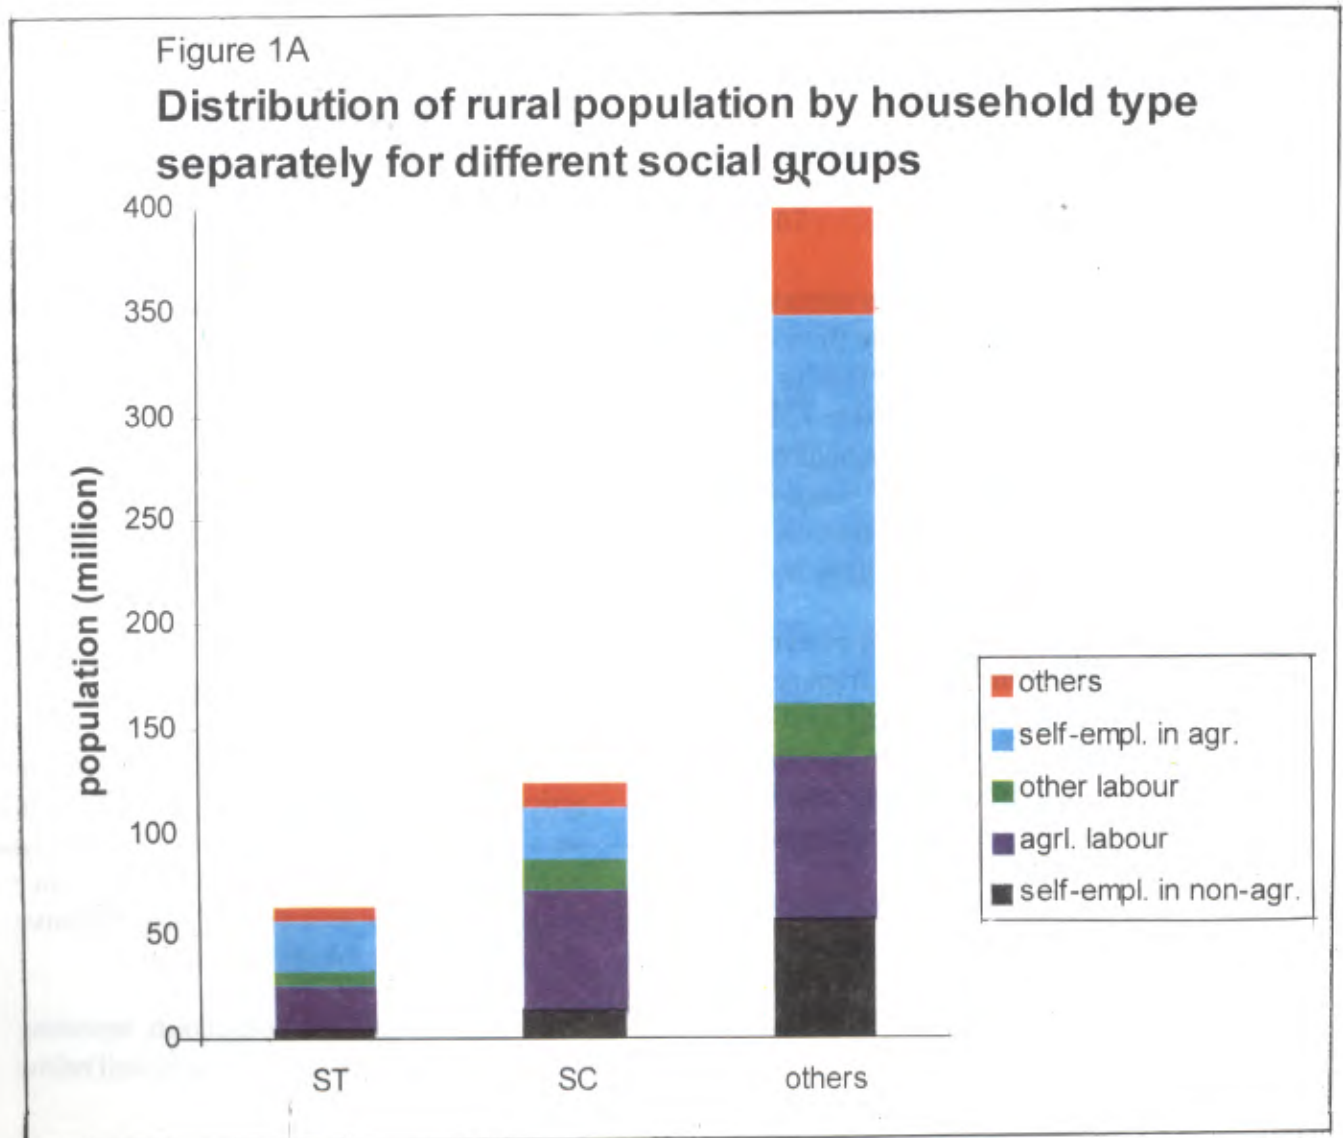

A household was classified as "agricultural labour", if its income from that source was 50% or more of its total income. The same criterion was followed to classify a household as "self-employed in agriculture". A household was classified as "self-employed in non-agriculture" if its income from that

source was greater than that from rural labour as well as that from all other gainful sources put together. If a household was not one of these three types but its income from total rural labour was greater than that from all self-employment and from other gainful sources, it was classified as "other labour". The remaining households were classified as "other households".

Urban

A household was classified as "self-employed", "regular wage or salary earning", or "casual labour", according to the major sources of its income from "gainful employment" during the 365 days preceding the date of survey. A household not having any income from gainful employment was classified under "others".

Household group : Three social groups were distinguished - scheduled tribe, scheduled caste, and other households.

SECTION 4

Summary of Findings

These findings are based on eight questions included in the household consumer expenditure schedule. They are : Did the household, during the last 365 days, receive any income from: 1. cultivation? 2. fishing and other agricultural enterprises? 3. wage/salaried employment? 4. non-agricultural enterprises? 5. pension? 6. remittances? 7. interest and dividends? 8. other sources?

For each of the eight sources, percentage of households reporting income from the source was tabulated by sector, state/u.t., household type and household social group, and the results are presented in Table 1R & 1U, Part-II. Survey Results

Trends at all-India level : all social groups

Urban

1. The most significant advance is observed in "interest and dividends", income from which is reported by 76 households per 1000 in 1993-94 compared to 44 in 1987-88. Table T2 shows that both the major urban household types - "self-employed" and "regular wage-salary earning" - have contributed to this increase, but "casual labour" households have not.
2. Minor increases are observed in percentages of households reporting income from pension (from 4.2 to 5%) and remittances (from 8.1 to 8.8%). Percentage of urban households reporting income from cultivation has declined from 8.5% to 8.0%, the decline being highest for casual labour households.
3. For all other sources of income, including "wage/salaried employment" and "non-agricultural enterprise", the change in percentage of income-reporting households is nil or negligible.

Rural

1. Again the largest change is observed in percentage reporting income from interest and dividends, which has more than doubled (from 1.1 to 2.5%) for "all households" as well as in the two "self-employed" categories. The proportion has, however, remained the same for agricultural labour (4 per 1000) and fallen for other labour (18 to 7 per 1000).
2. The percentage reporting income from cultivation has dropped by about 2 percentage points. Table T2 shows that the drop has been sharper for household types other than "self-employed in agriculture" and sharpest (nearly 4 percentage points from a 1987-88 level of 37%) for "other labour" households.

The pattern of variation over social groups in rural areas

Table T3 brings out, at the all-India level, the basic differences among social groups in the importance of different sources of income, and attempts to see whether these differences are of the same nature for different household types. The following conclusions can be drawn.

1. Even among households for which the pursuit of agriculture is not the principal activity, i.e. households other than those self-employed in agriculture, the proportion reporting cultivation (as a subsidiary activity) is over 30%, and the proportion reporting fishing or other agricultural activities is over 13%, irrespective of social group at the all-India level.
2. The proportion of SC households reporting income from cultivation (45.9%) is well below

Table T1: Trends in proportions of households reporting receipt of income from various sources

all-India

per 1000 no. of households source of income	reporting income during last 365 days from the source		
	43rd round 1987-88	50th round 1993-94	
			urban
cultivation	85	80	
fishing & other agr. enterpr.	49	50	
wage/salaried employment	626	626	
non-agr. enterprises	343	347	
pension	42	50	
remittances	81	88	
interest & dividends	44	76	
other sources	107	107	
			rural
cultivation	624	605	
fishing & other agr. enterpr.	197	195	
wage/salaried employment	567	565	
non-agr. enterprises	181	183	
pension	23	25	
remittances	82	79	
interest & dividends	11	25	
other sources	95	90	

- the average (60.5%) for all social groups (bottom two rows of the table). As a subsidiary activity, that is, of households other than those self-employed in agriculture, cultivation is reported less frequently by SC households than by other groups (e.g. 35.7% of SC agricultural labour households reported income from cultivation compared to 42.4% for all social groups).
3. On the other hand, the proportion of ST households reporting income from cultivation (68.5%) is 8 percentage points higher than the proportion for all social groups. Interestingly, among ST households in three of the household types pursuing cultivation as a subsidiary activity, the percentage reporting cultivation is a very high 52-53%.
 4. Percentages reporting income from fishing and other agricultural activities are somewhat lower among SC and ST households than the national average, but this differential is not uniformly present in every household type.
 5. The proportion reporting income from wage salaried employment is greatest for the SC group, which is estimated by this survey to account for over one-third of the population belonging to agricultural labour households in rural India (see also Figure 1).
 6. Proportion reporting income from non-agricultural household enterprises is lower than the national average (18%) for SC households (15%) and much lower for ST households (10%). Similar differences are noticed within most household types.
- Inter-state variation in proportions reporting income from different sources**
- Some areas where inter-state differences are significant are highlighted in Figures 2 to 5.
1. The percentage of rural households reporting income from cultivation varied from 50% to 80% in all major states except Kerala (where income from plantations was reported under other agricultural enterprises), Tamil Nadu and Punjab, where it was less than 40%.
 2. Income from fishing and other agricultural enterprises (other than cultivation) was reported by 61% of rural households in Kerala, 36% in Rajasthan, 28-29% in Punjab and Gujarat and within the range 15-25% in all other major states except Bihar (5%), M.P. (8%) and Orissa (11%).
 3. In rural areas, income from non-agricultural enterprises was reported by 29% households in West Bengal, and 13-23% households in other major states apart from M.P., where only 9% households reported it. In urban areas inter-state variation was much less, the percentage being within 32-36% in 8 major states, but clearly highest in U.P. (46%), followed by Punjab (41%).
 4. Income from remittances was reported by 8% of rural households and 9% of urban households in the country as a whole. The proportion was 18% for Kerala in both rural and urban areas, 14% in the urban sector of Tamil Nadu and 12% in its rural sector, 11-12% in Orissa, and 9-10% in Bihar. In Haryana & U.P. the percentage was much higher for rural than for urban areas. The percentage was lowest in M.P. among all major states, for both rural and urban areas.
 5. Interest or dividend income was reported in Gujarat, West Bengal, Maharashtra and Assam by 13-14% of all urban households, but by only 1.4% in Bihar, 2% in A.P. and M.P., and 3-8% in all other major states except Punjab (11%).
 6. The proportion of urban households reporting income from pension was within 4-6% in most major states.

A Note on Participation of Indian Women in Household Work and other Specified Activities, 1993-94

SECTION I

Introduction

1.0 The National Sample Survey Organisation (NSSO) carried out the fifth quinquennial survey on employment and unemployment in its 50th round survey operations during the period July, 1993 to June, 1994. Based on the survey results of Central Sample (i.e. the units surveyed by NSSO), three reports have been published already. The first of these gives an overview of the employment and unemployment situation in the country as a whole, while the second covers the situation in its cities and towns. The third report deals with the children's participation in economic activities vis-a-vis their school enrolment. The present document, the fourth in the series, deals with participation of women in household work and other specified household activities which resulted in economic benefits to their households.

1.1 A significant section of women 'usually' engaged in household chores, participate nominally in the activities of the household enterprises. They also undertake many activities which provide economic benefits to their households. Such participation of women, in certain cases when the participation in many nominal or when the activity carried out is a border line case of economic activity - is not reflected in the usual indicators of employment. Therefore, a set of probing questions were introduced on these aspects of women's activities, could, if necessary be used to work out an upper limit to the number of women usually engaged in economic activity irrespective of the intensity of participation during a reference year. To facilitate this study, the estimates of women participating in specific activities of household chores are presented in this document.

1.2 Similar information has also been collected for men usually engaged in household chores. Men engaged in household chores hold a very small proportion in the male population. They are, therefore, kept out of the purview of this report.

1.3 This document is based on five tables generated from the central sample covering, in all, 115,409 households spread over 11,653 sample villages/blocks. The number of villages/blocks and persons surveyed in different states and union territories is given in Table 3.8 of Section Three.

1.4 Geographical coverage : The fifth quinquennial survey covered the entire Indian Union excepting certain interior areas of Nagaland and Andaman & Nicobar Islands. However, in the state of Jammu & Kashmir out of the 14 districts, only 3 districts, namely, Jammu, Kathua and Udhampur could be surveyed. The remaining 11 districts were not surveyed. As such, the estimates pertaining to Jammu & Kashmir and All-India are exclusive of those 11 districts.

1.5 Layout of the note : After this introductory first section, the next one briefly gives the conceptual framework of the survey. Section three gives the sample design and estimation procedure. The main findings on women's participation in specified household activities are discussed in Section Four of the report. Detailed tables for India are given in the Part-II. In this connection, it may be noted that the estimates of aggregates given in the detailed tables help only to combine ratios. To arrive at the absolute number in any category, the survey estimates of ratios are to be applied on the projected population as on 1st January, 1994, the mid-point of the 50th round survey period of July, 1993 to June, 1994.

SECTION 2

Conceptual Framework

2.0 The main objective of the survey was to measure in quantitative terms, the nature and extent of employment and unemployment at disaggregated levels. To achieve this objective, the population surveyed is classified into various activity categories on the basis of the activities pursued by them during certain specified reference periods. Three reference periods used in the survey are (a) one year, (b) one week and (c) each day of the week. Based on these three periods, three different measures are arrived at. These are termed as usual status, current weekly status and current daily status. The broad activity categories adopted for the purpose are employed (working), unemployed and out of labour force. Since this document is concerned with the participation in specified household activities by women who were 'usually' engaged in household chores, the classification of activities according to usual status is described here.

2.1 Classification according to usual status approach: In this approach, the status of activity on which a person spent relatively longer time of the preceding 365 days from the date of survey is considered as the principal usual status activity of the person. Accordingly, a person is considered 'working or employed' if the person was engaged for a relatively longer time during the past year in any one or more work related activities (economic activities). The person is considered as 'seeking or available' for work or 'unemployed' if the person was not working but was either seeking or was available for work for a relatively longer time during the past year. If the person was engaged in any non-economic activities for a relatively longer time of the reference year, he/she is considered as 'out of labour force'. The specific activity category is determined on the basis of time spent criterion i.e., the activity on which major time was spent being assigned as the usual status activity. A person categorised as 'worker' or 'employed' on the basis of the principal status is called a 'principal status worker' or 'principal status employed'. A person categorised as a non-worker (i.e. unemployed or out of labour force) who pursued some economic activity in a subsidiary capacity is called a 'subsidiary status worker' or 'subsidiary status employed'. These two groups viz., principal status workers and subsidiary status workers together constitute 'all workers' according to the usual status classification.

2.2 It can be seen in the above paragraphs, central to the concept of identifying a worker is the engagement in any economic activity. The concept of economic activity as used in the NSS is explained now.

Economic activity is any activity that results in production of goods and services that adds value to national product. Such activities include production of all goods and services for market i.e. production for pay or profit and the production of primary commodities for own consumption and own account production of fixed assets, among the non-market activities. The entire spectrum of human activity falls in two categories: economic and non-economic activities. The economic activities have two parts:- market activities and non-market activities. Market activities are those that involve remuneration to those who perform it i.e. activity performed for pay or profit. These are essentially production of goods including those of Government services etc. Non market activities are the production for own consumption of primary products and own account production of fixed assets. The full spectrum of economic activities as defined in the UN system of National Accounts is not covered in the definition adopted for the current survey or in the previous surveys. The term economic activity as adopted in the 50th round survey include:

- i) All the market activities described above i.e. the activities performed for pay or profit which result in production of goods and services for exchange.
- ii) Of the non-market activities,
 - a) all the activities relating to the agricultural sector (industry section 0 of NIC 1987) which results in production (including gathering of uncultivated crops, forestry, collection of firewood, hunting, fishing etc.) of agricultural produce for consumption and
 - b) the activities relating to the own-account production of fixed assets. Own account production of fixed assets include construction of own houses, roads, wells, etc., and of machinery, tools etc. for household enterprise and also construction of any private or community facilities free of charge. A person may be engaged in own-account construction either in the capacity of a labour or a supervisor.

2.3 In this context, it may be noted that hitherto in NSS the term used was 'gainful activity'. The above definition is very close to the 'gainful activity' concept except for the inclusion of own-account production of fixed assets. The

contribution of this component was found to be negligible from a separate tabulation of this component in the 43rd round survey and as such the comparability of the survey results will be unaffected by this change.

2.4 According to the international standards, the term 'economically active population' comprises of persons of either sex who furnish the supply of labour for production of goods and services as defined in the United Nations system of national accounts and balances during a specified time reference period. According to these systems, the production of goods and services includes all production and processing of primary products, whether for market, for barter or for own consumption, the production of all other goods and services for the market and, in the case of households which produce such goods and services for the market, the corresponding production for own consumption. The definition adopted in the NSS follow the above approach very closely except for the 'processing of primary commodities for own consumption by the producers of these items' which is not covered by the NSS definition.

2.5 Workers or employed : Persons who are engaged in any economic activity or who despite their attachment to economic activity have abstained for reason of illness, injury or other physical disability, bad weather, festivals, social or religious functions or other contingencies necessitating temporary absence from work constitute workers. Unpaid helpers who assist in the operation of an economic activity in the household farm or non-farm activities are also considered as workers.

2.6 Seeking or available for work or unemployed : Persons who owing to lack of work had not worked but either sought work through employment exchanges, intermediaries, friends or relatives or by making applications to prospective employers or expressed their willingness or availability for work under the prevailing condition of work and remuneration are considered as those 'seeking or available for work or as unemployed'.

2.7 Labour force and those out of labour force : Persons who are either 'working' or seeking or available for work (i.e. unemployed) during the reference period constitute the labour force. Persons who were neither working and at the same time were not seeking nor available for work during the reference period are considered to be 'out of labour force'. The persons under this category are students, those engaged in domestic duties, rentiers, pensioners, recipients of remittances, those living on alms, infirm or disabled, too young or too old, prostitutes, smugglers etc., and casual workers not working due to sickness etc.. However, a domestic servant who is considered as a member of the employer's household is treated as a worker though he/she may be performing only household chores.

2.8 Activities pursued by persons not in labour force : For a person classified initially as 'not in labour force', the actual activity pursued was ascertained. Based on these information the following categories were considered :

	(code)
attended educational institutions	91
attended domestic duties only	92
attended domestic duties and was also engaged in freecollection of goods (vegetables, roots, fire-wood, etc. for household)	93
rentiers, pensioners, remittance recipients etc.	94
not able to work due to disability	95
beggars, prostitutes etc.	96
others	97
did not work due to sickness (for casual workers only)	98
infants of age 0-4 years	99

2.9 Women's participation in specified activities : Each person categorised as usually engaged in household duties in the principal status was asked whether he or she pursued certain specified activities more or less regularly for household consumption along with his/her normal house chores. The answers obtained were tabulated only for females. The activities were grouped into three broad categories :

- (i) activities relating to agricultural production like maintenance of kitchen garden, work in household poultry, dairy, etc. including free collection of agricultural products for household consumption,
- (ii) processing of primary products produced by the households for households' consumption and
- (iii) other activities for own consumption but resulting in economic benefits to the households.

Activities under (i) are obviously economic activities and if a person had pursued them in the principal status, he or she would be categorised as 'employed'. On the other hand, persons pursuing them only in a subsidiary status would be considered as employed in the subsidiary status provided his/her principal status activity was not any other 'work' activity. Thus, some of the women engaged in household duties in the principal status would be found engaged in the activities of group (i) and also working in the subsidiary status in view of their participation in these activities or also in other economic activities. Some women, however, found to be engaged only in these activities along with their house chores might not

have been classified as employed in the subsidiary status due to their non-pursua! of any other economic activity in a subsidiary capacity and the activities under group (i) pursued being only nominal. Such persons, however, could be considered to have pursued some economic activity though nominal in nature. Activities under group (ii), according to the recommendations of an International Standard, might be considered as economic. NSSO, however, had not so far considered them an economic when pursued only for own consumption. In case it is felt that these activities are to be considered as 'economic' persons pursuing these activities are also to be considered 'working'. The third category of activities are not economic when pursued for own consumption but obviously provide benefits to the households. Relevant results based on the answers to the various questions on participation of women usually engaged in domestic duties in the principal status are presented in this report separately for those with subsidiary (status) work and those without subsidiary (status) work for rural and urban India.

2.10 Procedural changes in the present survey: Apart from the changes in the definition and classification of the economically active persons mentioned above, a few other procedural aspects introduced in the classification of usual status and current weekly and daily status are explained now. These changes, it may be seen, do not in any way affect the comparability of the survey estimates with that of the previous rounds. In the past, for the identification of the usual status based on the major time criterion, a tri-chotomous classification of the population was followed. i.e. a person is classified into one of the three broad groups 'employed', 'unemployed' and out of labour force' based on the major time criterion. In this round, the procedure prescribed is a two stage dichotomous procedure which involves a classification into 'labour force' and 'out labour force' in the first stage and thereafter the labour force into 'employed' and 'unemployed' in the second stage. While this could marginally affect the principal and subsidiary classification theoretically, it can be seen that the 'all workers' would remain the same.

SECTION 3

Sample Design and Estimation Procedure

3.1 The sample design adopted for this round of survey was similar to that followed in the past surveys in its general aspects. The general scheme was a stratified two-stage design with the first stage units being villages in the rural areas and urban frame survey blocks (UFS) in the urban areas. The second stage units were the households.

3.2 Sampling frame for first stage units: The frame used for selection of first stage units in the rural sector was the 1991 census list of villages for all the four sub-rounds for 8 states/u.t.s viz. Andhra Pradesh, Assam, Kerala, Madhya Pradesh, Orissa, Uttar Pradesh, West Bengal and Chandigarh. However for Agra district of U.P. and the three districts, viz. Durg, Sagar, and Morena of M.P., samples were drawn using 1981 census list of villages. For Jammu & Kashmir samples for all the 4 sub-rounds were drawn using the 1981 census list as the 1991 census was not conducted in the state. For the remaining 23 states/u.t.s, the frame was 1991 census list for subrounds 2 to 4 and 1981 census list for sub-round 1 as the 1991 census list was not available for use at the time of drawing the samples. As usual, for Nagaland the list of villages within 5 kms. of the bus route and for Andaman and Nicobar Islands the list of accessible villages constituted the frame. In the case of urban sector the frame consisted of the UFS blocks and, for some newly declared towns where these were not available, the 1991 census enumeration blocks were used.

3.3 Region formation and stratification: States were divided into regions by grouping contiguous districts similar in respect of population density and cropping pattern. In rural sector each district was treated a separate stratum if the population was below 2 million and where it exceeded 2 million, it was split into two or more strata. This cut off point of population was taken as 1.8 million (in place of 2 million) for the purpose of stratification for districts for which the 1981 census frame was used. In the urban sector, strata were formed, within each NSS region on the basis of population size class of towns. However for towns with population of 4 lakhs or more the urban blocks were divided into two classes viz. one consisting of blocks inhabited by affluent section of the population and the other consisting of the remaining blocks.

3.4 Selection of first stage units: Selection of sample villages was done circular systematically with probability proportional to population and sample blocks circular systematically with equal probability. Both the sample villages and the sample blocks were selected in the form of two or more independent sub-samples. In Arunachal Pradesh

the procedure of cluster sampling has been followed. Further large villages/blocks having present population of 1200 or more were divided into a suitable number of hamlet-groups/sub-blocks having equal population content. Two hamlet-groups were selected from the larger villages while one sub-block was selected in urban sector for larger blocks.

3.5 Selection of households: While listing the households in the selected villages, certain relatively affluent households were identified and considered as second stage stratum 1 and the rest as second stage stratum 2. A total of 10 households were surveyed from the selected village/hamlet-groups, 2 from the first category and remaining from the second. Further in the second stage stratum-2, the households were arranged according to the means of livelihood. The means of livelihood were identified on the basis of the major source of income as i) self-employed in non-agriculture, ii) rural labour and iii) others. The land possessed by the households was also ascertained and the frame for selection was arranged on the basis of this information. The households were selected circular systematically from both the second stage strata.

3.6 In the urban blocks a different method was used for arranging the households for selection. This involved the identification means of livelihood of households as any one of a) self-employed, b) regular salaried/wage earnings, c) casual labour, d) others. Further the average household monthly per capita consumer expenditure (MPCE) was also ascertained. All households with MPCE of (i) Rs. 1200/- or more (in towns with population less than 10 lakhs or (ii) Rs. 1500/- or more (in towns with population 10 lakh or more) formed second-stage stratum 1 and the rest, second-stage stratum 2. The households of second-stage stratum 2 were arranged according to means of livelihood class and MPCE ranges before selection of sample households. A total of 10 households were selected from each sample block as follows

(i) For affluent strata/classes : 4 households from second-stage stratum 1 and 6 households from second-stage stratum 2 (ii) For other strata/classes : 2 households from second stage stratum 1 and 8 from second-stage stratum 2. Households were then selected circular systematically with a random start. Shortfall in the required number of household in any second-stage stratum was made up by increasing the quota for the other second stage stratum.

3.7 Work programme: The survey period of one year was divided into four sub-rounds of three months duration each as below. Equal number of sample villages and blocks was

allotted for survey in each of these sub-rounds. However in Andaman and Nicobar Islands, Lakshadweep, and rural areas of Arunachal Pradesh and Nagaland, the restriction of surveying the allotted households during the sub-round period was not strictly enforced.

Period of survey for the four sub-rounds

sub-round	period of survey
1	July-September, 1993
2	October- December, 1993
3	January-March, 1994
4	April-June, 1994

3.8 No. of villages/blocks, households and persons surveyed: The number of villages/blocks and persons surveyed in different states and union territories is given in Table (3.8). The information relates to all the sub-rounds covered. As reported in Para 1.7 in Jammu and Kashmir the survey work was undertaken in the districts of Jammu, Kathua and Udhampur only. The remaining 9 districts were not surveyed. Therefore, the estimates pertaining to all India and Jammu and Kashmir will be exclusive of these districts.

3.9 Estimation Procedure

3.9.1 Estimation of aggregates at sub-sample level : Aggregates are first estimated at sub-sample level according to the following estimation formulae, where \hat{Y} denotes the estimate - based on one sub-sample - of the aggregate of a given characteristic Y for the rural sector of a state/u.t.

$$\hat{Y} = \sum_s \frac{1}{n_s} \sum_{i=1}^{P_{si}} \frac{P_{si} D_{si}^*}{P_{si}} \sum_{t=1}^2 \frac{H_{sit}}{h_{sit}} \sum_{j=1}^{h_{sit}} y_{sitj}$$

For the rural sector of Arunachal Pradesh,

$$\hat{Y} = \sum_s \frac{1}{n_s} \sum_{i=1}^{N_{si}} N_{si} \sum_{t=1}^2 \frac{H_{sit}}{h_{sit}} \sum_{j=1}^{h_{sit}} y_{sitj}$$

For the urban sector of a state/u.t.,

$$\hat{Y} = \sum_s \frac{N_s}{n_s} \sum_{i=1}^{N_s} D_{si} \sum_{t=1}^2 \frac{H_{sit}}{h_{sit}} \sum_{j=1}^{h_{sit}} y_{sitj}$$

where

y : observed value of the same characteristic in a sample household

- s : stratum suffix
t : second-stage stratum suffix
i : sample village/block suffix
j : sample household suffix
D : number of hamlet-groups / sub-blocks formed in the surveyed village/block
H : number of households listed in the second-stage sampling frame
h : number of sample households surveyed
P : population of sample village as in the sampling frame
N : for the urban sector, number of blocks in the sampling frame
n : number of sample villages/blocks surveyed in this sub-sample
P_{si} : population of the s-th stratum as per frame used in the selection of i-th sample village of the stratum
N_{si} : for Arunachal Pradesh, number of sample villages in the sampling frame for s-th stratum which was used in selection of i-th sample village of the stratum
D* : equals 1, if D = 1
equals D/2, if D > 1

3.9.2 Estimation of aggregates for the combined sample (pooling sub-samples) : The combined sample estimate of an aggregate is obtained as the simple average of the corresponding sub-sample estimates.

3.9.3 Estimates of ratios : The estimate of a ratio of the form R = Y/X, where Y and X are the population aggregates of two characters, is obtained as

$$\hat{R} = \frac{\hat{Y}}{\hat{X}}$$

where \hat{Y} and \hat{X} are estimates of Y and X obtained according to the procedure laid down in para

3.9.1. Examples of ratio estimates are rates and percentages.

SECTION 4

Main Findings

4.0 A significant section of women usually engaged in household duties participate nominally in the activities of the household enterprises. They also undertake many activities which provide economic benefits to their households. Such participation of women, in certain cases - when the participation is very nominal or when the activity carried out is a borderline economic activity - is not always reflected in the usual indicators of employment. A set of probing questions was, therefore, introduced on women's participation in a number of borderline cases of economic activities along with others which provide benefits to their households. The specific activities considered in the survey for this purpose and the results giving the participation rates in those activities are presented in Table 4.1 for the country as a whole and in Table 4.1.1 for 16 major states. The discussions are confined to the results relating to all-India only. Tables giving the summary results for the major states are put together at the end of this section.

4.1 The probing questions on the availability of work at the household premises, type and nature of work acceptable, type of assistance required etc., were also canvassed in the survey. In this section some of the results based on the answers to this special set of probing questions are also presented separately for rural and urban sectors of the major states and India.

4.2 Women's participation in specified activities: During 1993-94, about 29 per cent of rural women and 42 per cent of urban women in India were usually (principal and subsidiary) engaged only in household duties, while 33 and 16 per cent of rural and urban women respectively, usually carried out some economic activities. Each person categorised as usually engaged in household duties in terms of his or her principal status was asked whether he or she pursued certain specific activities more or less regularly for household consumption also along with his/her normal house chores. The answers obtained were tabulated only for women. The activities were grouped into three broad categories :

- (i) activities relating to agricultural production such as the maintenance of kitchen garden, work in household poultry, dairy, etc., including free collection of agriculture products for household consumption,
- (ii) processing of primary products produced by the households for household consumption and
- (iii) other activities for own consumption but resulting in economic benefits to households.

As explained in para 2.9. of section Two, activities listed as 1, 2, 3 and 4 in Table 4.1 are economic activities. Activities 5 to 9 fall under group (ii) and according to the recommendations of an International Standard, might be considered as economic. The rest of the activities (items 10 to 19) are considered under group (iii). The third group of activities are not economic when pursued for own consumption but certainly provide benefits to the households. It is seen that of those women classified as usually engaged in the household duties in the principal status, about 64 per cent in rural areas and 16 per cent in urban areas pursued one or more of the activities under group (i) and (ii) along with their house chores for household consumption. It may be noted that some of the women pursuing those activities were initially categorised as working in a subsidiary activity and the rest as not working even in terms of their subsidiary status. The second category of women formed about 58 per cent and 14 per cent of those engaged in household duties and without any subsidiary (status) work in rural and urban India respectively. They constituted 17.0 per cent of women in rural areas and 5.8 per cent in urban areas. An upper limit of women worker population ratio, therefore, can approximately be obtained by raising the population ratio of all women workers (principal and subsidiary status) by adding to them the above proportions. The results corresponding to Table 4.1 are given for the major states in Table 4.1.1.

4.3 Availability of women for work in household premises : As mentioned earlier, it may be noted that a large section of women even if they are not working, do not report themselves as unemployed as many among them may not be willing to come out of their house premises for work. But some of them may be willing to accept certain types of work if it is made available at their house premises. The special probing enquiry carried out along with the survey, therefore, included questions on their availability for 'work' in their house premises, nature and type of work acceptable, etc. The relevant information was tabulated only for women aged 15 years and above. Table 4.2 gives the proportion of women aged 15 years and above categorised as engaged in household duties and willing to accept 'work' in their house premises to total women of age 15 years and above engaged in household duties for rural and urban India. It is observed that of the women of age 15 years and above usually engaged in household duties, a good proportion of women had reported

availability for 'work' in their house premises (30 per cent in rural India and 27 per cent in urban India). They constituted 17 per cent of the women (15+) in both rural and urban India. Like the 43rd round results, the 50th round data reveal that the most preferred work by women related to dairy, spinning & weaving and tailoring. The corresponding results for the major states are given in Table 4.2.1.

4.4 Nature of work acceptable : Each woman reported as available for a particular type of work in her household premises, was also asked about the nature of work (i.e., regular full time, regular part time or only occasional) acceptable to her. Relevant results based on the tabulation of the responses obtained are presented for rural and urban India in Table 4.3 and for the major states in Table 4.3.1. It is observed that about 63 to 68 per cent of women of age 15 years and above reporting availability for work in their household premises preferred only 'part time' work on a regular basis and 27 to

33 per cent preferred regular 'full time' work.

4.5 Assistance required : For taking up any 'work' in the household, if it is in a self-employed capacity, some assistance, in terms of finance, training, etc., is obviously required. The set of probing questions, therefore, included also a question on the 'type of assistance' required by women reporting availability for work in household premises. Table 4.4 gives the distribution of women of age 15 years and above engaged in the principal status in household duties and willing to accept work in the household premises by 'type of assistance' required for taking up the reported 'work'. The results have revealed that the majority of the women willing to work in the house premises need either 'initial finance on easy terms' or 'working finance facilities' to take up their desired activity. The corresponding results for 16 major states are given in Table 4.4.1.

A Note on Economic Activities and School Attendance by Children of India, NSS 50th Round (July 93-June 94)

Section 1

Introduction

1.0 The National Sample Survey Organisation (NSSO) carried out the fifth quinquennial survey on employment and unemployment in its 50th round survey operations during the period July, 1993 to June, 1994. Based on the survey results of Central Sample (i.e. the units survey by NSSO), two reports have been published already; one revealing the employment and unemployment situation for the country as a whole and the another for its cities and towns. The present document, the third in the series, deals with children's participation in economic activity vis-a-vis their school enrolment.

1.1 In this round, NSSO attempted, for the first time to generate an education and activity profile of children (in the age-group 5-14 years). Information was collected on school attendance and participation in household chores and work related activities.

1.2 It is important to place here that the 'usual' status approach based on the economic activity pursued by a person during last 365 days preceding the date of survey was not strictly followed. Instead of 'major time' criterion used in the 'usual' status approach to identify participation in economic activity, a 'reasonable regularity' criterion was adopted to identify participation by a child in economic activity. A child was considered 'working' if he/she has spent some time, albeit nominal, in any 'work' with some regularity which might be seasonal.

1.3 The children who were working, for their information on type of work pursued, whether working in manufacturing or building construction industry, reason for working and effect of work on studies at home and schooling were collected. Children working in specific hazardous activities in manufacturing and building construction industry, called 'process' have received attention in many discussions. To

elicit the situation, the process in which the children worked was collected. This apart, answers to some probing questions on reason for seeking/available for work and reason for not currently attending school to the relevant groups had increased the domain of information. The estimates based on these information are presented in this document.

1.4 This document is based on nine tables generated from the central sample covering, in all, 115,409 households spread over 11,653 sample villages/blocks. The number of villages/blocks and persons surveyed in different States and Union Territories is given in Table 3.8 of section three.

1.5 Geographical coverage : The fifth quinquennial survey covered the entire Indian Union excepting certain interior areas of Nagaland and Andaman & Nicobar Islands. However, in the state of Jammu & Kashmir out of the 14 districts, only 3 districts, namely, Jammu, Kathua and Udhampur could be surveyed. The remaining 11 districts were not surveyed. As such, the estimates pertaining to Jammu & Kashmir and All-India are exclusive of those 11 districts.

1.6 Layout of the note : After this introductory first section, the next one briefly gives the conceptual framework of the survey. Section Three gives the sample design and estimation procedure. The main findings on activities of children are discussed in Section Four. Detailed tables for India are given in the Survey Results. In this connection, it may be noted that the estimates of aggregates given in the detailed tables help only to combine ratios. To arrive at the absolute number in any category, the survey estimates of ratios are to be applied on the projected population as on 1st January, 1994, the mid-point of the 50th round survey period of July, 1993 to June, 1994.

Section 2

Conceptual framework

2.0 The main objective of the survey was to measure in quantitative terms, the nature and extent of employment and unemployment at disaggregated levels. To achieve this objective, the population surveyed is classified into various activity categories on the basis of the activities pursued by them during certain specified reference periods. Three reference periods used in the survey are (a) one year, (b) one week and (c) each day of the week. Based on these three periods, three different measures are arrived at. These are termed as usual status, current weekly status and current daily status. The broad activity categories adopted for the purpose are employed (working), unemployed and out of labour force. Since this document is concerned with the economic activities as well as school enrolment by children and a concept similar to 'usual' status approach was followed for identifying the participation of children in economic activity, the classification of activities according to usual status is described here.

2.1 Classification according to usual status approach: In this approach, the status of activity on which a person spent relatively longer time of the preceding 365 days from the date of survey is considered as the principal usual status activity of the person. Accordingly, a person is considered 'working or employed' if the person was engaged for a relatively longer time during the past year in any one or more work related activities (economic activities) including seeking or being available for work. The person is considered as 'seeking or available' for work or 'unemployed' if the person was not working but was either seeking or was available for work for a relatively longer time during the past year. If the person was engaged in any non-economic activities for a relatively longer time of the reference year, he/she is considered as 'out of labour force'. The specific activity category is determined on the basis of time spent criterion i.e., the activity on which major time was spent being assigned as the usual status activity. A person categorised as 'worker' or 'employed' on the basis of the principal status is called a 'principal status worker' or 'principal status employed'. A person categorised as a non-worker (i.e. unemployed or out of labour force) who pursued some economic activity in a subsidiary capacity is called a 'subsidiary status worker' or 'subsidiary status employed'. These two groups viz., principal status workers and subsidiary status workers together constitute 'all workers' according to the usual status classification.

2.2 It can be seen in the above paragraphs, central to the concept of identifying a worker is the engagement in any

economic activity. The concept of economic activity as used in the NSS is explained now.

Economic activity is any activity that results in production of goods and services that adds value to national product. Such activities include production of all goods and services for market i.e. production for pay or profit and the production of primary commodities for own consumption and own account production of fixed assets, among the non-market activities. The entire spectrum of human activity falls in two categories: economic and non-economic activities. The economic activities have two parts:- market activities and non-market activities. Market activities are those that involve remuneration to those who perform it i.e. activity performed for pay or profit. These are essentially production of goods including those of Government services etc. Non market activities are the production for own consumption of primary products and own account production of fixed assets. The full spectrum of economic activities as defined in the UN system of National Accounts is not covered in the definition adopted for the current survey or in the previous surveys. The term economic activity as adopted in the 50th round survey include:

- i) All the market activities described above i.e. the activities performed for pay or profit which result in production of goods and services for exchange.
- ii) Of the non-market activities,
 - a) all the activities relating to the agricultural sector (industry section 0 of NIC 1987) which results in production (including gathering of uncultivated crops, forestry, collection of firewood, hunting, fishing etc.) of agricultural produce for consumption and
 - b) the activities relating to the own-account production of fixed assets. Own account production of fixed assets include construction of own houses, roads, wells, etc., and of machinery, tools etc. for household enterprise and also construction of any private or community facilities free of charge. A person may be engaged in own-account construction either in the capacity of a labour or a supervisor.

2.3 In this context, it may be noted that hitherto in NSS the term used was 'gainful activity'. The above definition is

very close to the 'gainful activity' concept except for the inclusion of own-account production of fixed assets. The contribution of this component was found to be negligible from a separate tabulation of this component in the 43rd round survey and as such the comparability of the survey results will be unaffected by this change.

2.4 According to the international standards the term 'economically active population' comprises of persons of either sex who furnish the supply of labour for production of goods and services as defined in the United Nations system of national accounts and balances during a specified time reference period. According to these systems, the production of goods and services includes all production and processing of primary products, whether for market, for barter or for own consumption, the production of all other goods and services for the market and, in the case of households which produce such goods and services for the market, the corresponding production for own consumption.¹ The definition adopted in the NSS follow the above approach very closely except for the 'processing of primary commodities for own consumption by the producers of these items' which is not covered by the NSS definition.

2.5 Workers or employed : Persons who are engaged in any economic activity or who despite their attachment to economic activity have abstained for reason of illness, injury or other physical disability, bad weather, festivals, social or religious functions or other contingencies necessitating

temporary absence from work constitute workers. Unpaid helpers who assist in the operation of an economic activity in the household farm or non-farm activities are also considered as workers.

2.6 Seeking or available for work or unemployed : Persons who owing to lack of work had not worked but either sought work through employment exchanges, intermediaries, friends or relatives or by making applications to prospective employers or expressed their willingness or availability for work under the prevailing condition of work and remuneration are considered as those 'seeking or available for work or as unemployed'.

2.7 Labour force and those out of labour force : Persons who are either 'working' or seeking or available for work (i.e. unemployed) during the reference period constitute the labour force. Persons who were neither working and at the same time were not seeking nor available for work during the reference period are considered to be 'out of labour force'. The persons under this category are students, those engaged in domestic duties, rentiers, pensioners, recipients of remittances, those living on alms, infirm or disabled, too young or too old, prostitutes, smugglers etc., and casual workers not working due to sickness etc.. However a domestic servant who is considered as a member of the employer's household is treated as a worker though he/she may be performing only household chores.

¹ Surveys of economically active population, employment, unemployment and under-employment: An ILO manual on concepts and methods, ILO, Geneva, 1990

Section 3

Sample Design and Estimation Procedure

3.1 The sample design adopted for this round of survey was similar to that followed in the past surveys in its general aspects. The general scheme was a two stage stratified design with the first stage units being villages in the rural areas and urban frame survey blocks (UFS) in the urban areas. The second stage units were the households.

3.2 Sampling frame for first stage units: The frame used for selection of first stage units in the rural sector was the 1991 census list of villages for all the four sub-rounds for 8 states/u.t.s viz. Andhra Pradesh, Assam, Kerala, Madhya Pradesh, Orissa, Uttar Pradesh, West Bengal and Chandigarh. However for Agra district of U.P. and the three districts, viz. Durg, Sagar, and Morena of M.P., samples were drawn using 1981 census list of villages. For Jammu & Kashmir samples for all the 4 sub-rounds were drawn using the 1981 census list as the 1991 census was not conducted in the state. For the remaining 23 states/u.t.s, the frame was 1991 census list for subrounds 2 to 4 and 1981 census list for sub-round 1 as the 1991 census list was not available for use at the time of drawing the samples. As usual, for Nagaland the list of villages within 5 kms. of the bus route and for Andaman and Nicobar Islands the list of accessible villages constituted the frame. In the case of urban sector the frame consisted of the UFS blocks and, for some newly declared towns where these were not available, the 1991 census enumeration blocks were used.

3.3 Region formation and stratification: States were divided into regions by grouping contiguous districts similar in respect of population density and cropping pattern. In rural sector each district was treated a separate stratum if the population was below 2 million and where it exceeded 2 million, it was split into two or more strata. This cut off point of population was taken as 1.8 million (in place of 2 million) for the purpose of stratification for districts for which the 1981 census frame was used. In the urban sector, strata were formed, within each NSS region on the basis of population size class of towns. However for towns with population of 4 lakhs or more the urban blocks were divided into two classes viz. one consisting of blocks inhabited by affluent section of the population and the other consisting of the remaining blocks.

3.4 Selection of first stage units: Selection of sample villages was done circular systematically with probability proportional to population and sample blocks circular systematically with equal probability. Both the sample villages and the sample blocks were selected in the form of two or more independent sub-samples. In Arunachal Pradesh the

procedure of cluster sampling has been followed. Further large villages/blocks having present population of 1200 or more were divided into a suitable number of hamlet-groups/sub-blocks having equal population content. Two hamlet-groups were selected from the larger villages while one sub-block was selected in urban sector for larger blocks.

Period of survey for the four sub-rounds

sub-round	period of survey
1	July-September, 1993
2	October- December, 1993
3	January-March, 1994
4	April-June, 1994

3.5 Selection of households: While listing the households in the selected villages, certain relatively affluent households were identified and considered as second stage stratum 1 and the rest as second stage stratum 2. A total of 10 households were surveyed from the selected village/hamlet-groups, 2 from the first category and remaining from the second. Further in the second stage stratum-2, the households were arranged according to the means of livelihood. The means of livelihood were identified on the basis of the major source of income as i) self-employed in non-agriculture, ii) rural labour and iii) others. The land possessed by the households was also ascertained and the frame for selection was arranged on the basis of this information. The households were selected circular systematically from both the second stage strata.

3.6 In the urban blocks a different method was used for arranging the households for selection. This involved the identification means of livelihood of households as any one of a) self-employed, b) regular salaried/wage earnings, c) casual labour, d) others. Further the average household monthly per capita consumer expenditure (mpce) was also ascertained. All households with MPCE of (i) Rs. 1200/- or more (in towns with population less than 10 lakhs or (ii) Rs. 1500/- or more (in towns with population 10 lakh or more) formed second-stage stratum 1 and the rest, second-stage stratum 2. The households of second-stage stratum 2 were arranged according to means of livelihood class and MPCE ranges before selection of sample households. A total of 10 households were selected from each sample block as follows

- (i) For affluent strata/classes : 4 households from second-stage stratum 1 and 6 households from second-stage stratum 2
- (ii) For other strata/classes : 2 households from second stage stratum 1 and 8 from second-stage stratum 2. Households were then selected circular systematically with a random start. Shortfall in the required number of household in any second-stage stratum was made up by increasing the quota for the other second stage stratum.

3.7 Work programme: The survey period of one year was divided into four sub-rounds of three months duration each as below. Equal number of sample villages and blocks was allotted for survey in each of these sub-rounds. However in Andaman and Nicobar Islands, Lakshadweep, and rural areas of Arunachal Pradesh and Nagaland, the restriction of surveying the allotted households during the sub-round period was not strictly enforced.

3.8 No. of villages/blocks, households and persons surveyed: The number of villages/blocks and persons surveyed in different States and Union Territories is given in Table 3.8. The information relates to all the sub-rounds covered. As reported in Para 1.7 in Jammu and Kashmir the survey work was undertaken in the districts of Jammu, Kathua and Udhampur only. The remaining 9 districts were not surveyed. Therefore the estimates pertaining to all India and Jammu and Kashmir will be exclusive of these districts.

3.9 Estimation Procedure

3.9.1 Estimation of aggregates at sub-sample level : Aggregates are first estimated at sub-sample level according to the following estimation formulae, where \hat{Y} denotes the estimate - based on one sub-sample - of the aggregate of a given characteristic Y for the rural sector of a state/u.t.

$$\hat{Y} = \sum_s \frac{1}{n_s} \sum_i \frac{P_{si} D_{si}^*}{P_{si}} \sum_{t=1}^2 \frac{H_{sit}}{h_{sit}} \sum_{j=1}^{h_{sit}} y_{sitj}$$

For the rural sector of Arunachal Pradesh,

$$\hat{Y} = \sum_s \frac{1}{n_s} \sum_{i=1}^{n_s} N_{si} \sum_{t=1}^2 \frac{H_{sit}}{h_{sit}} \sum_{j=1}^{h_{sit}} y_{sitj}$$

For the urban sector of a state/u.t.,

$$\hat{Y} = \sum_s \frac{N_s}{n_s} \sum_{i=1}^{n_s} D_{si} \sum_{t=1}^2 \frac{H_{sit}}{h_{sit}} \sum_{j=1}^{h_{sit}} y_{sitj}$$

- where
- y : observed value of the same characteristic in a sample household
- s : stratum suffix
- t : second-stage stratum suffix
- i : sample village/block suffix
- j : sample household suffix
- D : number of hamlet-groups / sub-blocks formed in the surveyed village/block
- H : number of households listed in the second-stage sampling frame
- h : number of sample households surveyed
- P : population of sample village as in the sampling frame
- N : for the urban sector, number of blocks in the sampling frame
- n : number of sample villages/blocks surveyed in this sub-sample
- P_{si} : population of the s -th stratum as per frame used in the selection of i -th sample village of the stratum
- N_{si} : for Arunachal Pradesh, number of sample villages in the sampling frame for s -th stratum which was used in selection of i -th sample village of the stratum
- D^* : equals 1, if $D = 1$
equals $D/2$, if $D > 1$

3.9.2 Estimation of aggregates for the combined sample (pooling sub-samples) : The combined sample estimate of an aggregate is obtained as the simple average of the corresponding sub-sample estimates.

3.9.3 Estimates of ratios : The estimate of a ratio of the form $R = Y/X$, where Y and X are the population aggregates of two characters, is obtained as

$$\hat{R} = \frac{\hat{Y}}{\hat{X}}$$

where \hat{Y} and \hat{X} are estimates of Y and X obtained according to the procedure laid down in para 3.9.1. Examples of ratio estimates are rates and percentages.

Section 4

Main Findings

4.0 As mentioned earlier, this chapter outlines certain key characteristics of children's activities including school attendance. In the survey, particulars were collected for children aged 5-14 years. In this age-group, the survey covered 85,152 rural children and 46058 urban children. The estimates are given for India as a whole. The corresponding estimates for different states and union territories are not given here due to small sample size for many correlates.

4.1 The survey has estimated that 36.1 per cent of the Indian population consisted of children under 15 years of age; among them, children aged 5-14 years formed 66 per cent. There were more boys (53 per cent) than girls (47 per cent) in the age-group (5-14). About 77 per cent of Indian children lived in rural areas. Since information on activities of children was collected for those in the age-group 5-14 years only, the results and the following discussions in this chapter related to only the children of age 5-14 years (hereinafter referred to as children).

4.2 Of the children, about 6.3 per cent were workers (according to usual principal and subsidiary status) - they formed 3.2 per cent of Indian work-force. About 89 per cent of child

workers were from the rural areas and 11 per cent - much lower than its population share- from the urban areas. The male-female ratio was 54:46 among child workers.

4.3 **School attendance** : Table 4.3 gives the distribution of children by status of school attendance at the all-India level. It is observed that the school attendance rate for girls was much lower than that for boys. Further, the gap was wider in the rural areas. While the school attendance rate among the boys was 70 per cent in the rural areas and 85 per cent in the urban areas, it was 55 per cent and 80 per cent among the girls in the rural and urban areas respectively. Another aspect of children's education is the dropping out from school. For the purpose of this survey, the children who discontinued their studies before completing the class/level they had attended last, were considered drop-outs. The drop-out rate for girls was much higher than the boys and was higher in the rural areas. Out of every 100 girls who were ever enrolled in school, 42 in rural India and 18 in urban India dropped out from the class/level they had attended last. The corresponding numbers for boys were 27 and 14. The third category of children who had not attended any school, was about 2 to 4 per cent of children.

Source : Table 85.

4.4 School attendance - relationship with MPCE : Table 4.4 shows that there is a positive relationship, as expected, between the school attendance and monthly per capita expenditure (MPCE). Lower attendance with higher drop-out rate is the feature of the lower MPCE classes. The attendance rate increases and drop-out rate decreases gradually as the MPCE increases, in both rural and urban areas. Of children who had 'never attended' a school, the proportions did not change significantly with MPCE, but it had a tendency to fall marginally as the MPCE increased.

4.5 Working children: As mentioned in chapter one, the 'usual' status approach based on the economic activity pursued by a child during the 365 days preceding the survey was not strictly followed. Instead, a 'reasonable regularity' crite-

ri-
on was adopted to identify participation by a child in economic activity. Based on this, the proportions of child workers obtained are presented in Table 4.5 for rural and urban India. About 7 to 8 per cent of rural children and a little lower, 3 to 4 per cent of urban children had worked, albeit nominally, with 'reasonable regularity'. The work of 77 to 89 per cent of working children had resulted in economic benefits to their households. The sex differentials in work participation rates appear to be insignificant in rural and urban areas. On the other hand, proportion of girls helping in household chores (which is not considered as economic activity) was considerably higher than that of boys in both the rural and urban areas. About 31 to 34 per cent of girls helped in household chores as against 24 to 26 per cent of boys.

TABLE 4.5 : NUMBER OF CHILDREN OF AGE 5-14 YRS. (I) HELPING IN HOUSE-HOLD CHORES AND (II) WORKING PER 1000 CHILDREN OF AGE 5-14 YEARS, AND NUMBER OF CHILDREN WHOSE WORK HELPED HOUSEHOLDS ECONOMICALLY PER 1000 CHILDREN WORKING FOR EACH SEX

Source : Tables 83 & 84

4.6 Working children by status of school attendance : The proportion of working children and proportion of children helping in their household chores have been estimated for different school attendance statuses also and presented in Table 4.6. The results reveal that the proportion of girls helping in household chores was higher than that of boys in all the school attendance statuses. On the other hand, proportion of workers was higher among boys than among girls, particularly in rural areas, in all the school attendance statuses. Secondly, the proportion of working children or children helping in household chores was highest among the drop-outs and the sex-differentials in these proportions were maximum among the drop-outs. Evidently, even in the age-group 5-14, more girls than boys are assigned the tasks of looking after the siblings and household chores.

4.7 Activities of working children : The results given in Table 4.7 show the type of activity pursued by working children. In rural areas, a majority of working children was engaged in household enterprises and mainly in the agriculture sector. In urban areas, on the other hand, a majority of the working children worked as hired labourers and mainly in the non-agriculture sector. About 63 to 65 per cent of working children in the rural areas worked in their household enterprises, of them 79 to 82 per cent worked in the household agricultural enterprises. About 35 to 37 per cent worked as hired labourers. In urban areas, a little less than 60 per cent of working children worked as hired labourers and the rest in the household enterprises. The non-agricultural sector absorbed about 81 to 86 per cent of working children in urban areas.

4.8 Working children in hazardous activities : For the children working in specific hazardous activities in 'manufacturing and building & construction industries', informa-

tion on the 'process' in which they were working was collected in the survey. The results obtained are presented in Table 4.8 showing the proportion of working children engaged in 'manufacturing and building & construction industries' and their distribution by 'process' in which working. It may be mentioned here that 14 hazardous processes relating to these industries were identified for collecting information in the survey. The survey could find 645 sample children, 338 in the rural and 307 in the urban areas, working in 'manufacturing and building & construction industries'. Of them, the 'process' in which they worked, was found to be 'not recorded' for 408 cases. Further the survey could not net any child working in the 4 processes, viz. shellac manufacturing; soap manufacturing; manufacturing of products from agate, and manufacturing processes using toxic materials and substances. It is evident that the survey has not been able to gather data on the participation of child workers in hazardous activities. Further, the number of children in the sample, working in some of the processes was also very small. In order to have an idea about the reliability of the estimates given in Table 4.8, the number of sample children working in different processes is given in parentheses.

4.8.1 It is seen that the proportion of working children engaged in 'manufacturing and building & construction industries' was about 7 per cent in rural areas and 24 per cent in urban areas. About 26 per cent of rural boys working in these industries were engaged in the 'cloth painting / dyeing and weaving' and 6 per cent in 'bidi making'. The corresponding percentages were 13 and 4 for urban boys. In the case of rural girls working in these industries, about 26 per cent were engaged in 'bidi making' and 16 per cent in 'cloth painting/dyeing and weaving' compared to 23 per cent and 19 per cent, respectively for urban girls. Only 2 to 5 per cent of children working in hazardous industries were engaged in 'carpet weav-

total	1000	1000	1000	1000

Source : Table 86 ; Note : Figures in parentheses give sample children working in that process

ing'. The proportions of children working in rest of the processes were found to be very small.

4.9 Children seeking/available for work: Some of the children who were not attending school and who did not work, were seeking/available for work. They constituted about 1 to 2 per cent of children who had dropped out and less than 1 per cent of those who had never attended any school (see Table 91 of Survey Results Part-II). A majority of them were seeking/available for work to add income to their household.

4.10 Reason for working : Table 4.10 shows the distribution of working children by reason for working. The principal reason for working was "to supplement household income" - reported for by 57 to 63 per cent working children. About 18 to 20 per cent of working children in rural areas and 7 to 8 per cent in urban areas reported "shortage of labour in household enterprise" as the reason for their working. Other reasons accounted for a very small proportion of working children.

4.11 Effect of work on studies : Information relating to effect of work on studies was collected from the working children who were also attending school. The relevant results,

given in Table 4.11 show that a higher proportion of working boys than the girls had to miss school either intermittently or regularly, and they were unable either to do home work or to prepare for test/examination. The proportion of children who had missed school or were unable to prepare for studies due to work was higher in rural areas than in urban areas. About 22 to 36 per cent working children in rural areas had to miss school as against 5 to 10 per cent of working children in urban areas. Further, about 20 to 25 per cent of working children in rural and 8 to 10 per cent in urban areas were unable to prepare for their studies due to work.

4.12 Reason for not currently attending : The reason for not attending the school was ascertained for the children who were not currently attending - about 21 to 30 per cent of them were reported as being 'not interested' in studies and about 15 to 20 per cent reported that they could not afford. About 6 to 10 per cent of the children did not attend school as they had to 'participate in household economic activity' or to 'work for wage/salary'. In order to 'take care of siblings' or to 'attend household chores as the other members engaged in work', about 3 to 4 per cent of girls could not attend school as against 1 to 2 per cent of boys. The reason of being 'too young to go to school' was reported for by 12 to 17 per cent of children.

1. Survey Results on Nutritional Intake in India-NSS 50th Round (July 1993 - June 1994)
2. Survey Results on Sources of Household Income in India-NSS 50th Round (July 1993-June 1994)
3. Survey Results on Participation of Indian Women in Household Work and Other Specified Activities-NSS 50th Round (July 1993-June 1994)
4. Survey Results on Economic Activities and School Attendance by Children of India-NSS 50th Round (July 1993-June 1994)

LIST OF ALL-INDIA DETAILED TABLES

Table No.	Description	Page No.
Table (1) :	Per capita and per consumer unit intake of calorie, protien and fat per diem for each monthly per capita expenditure class	S-1 to S 34
Table (2) :	Percentage (0.00) of total intake of calorie and protien from different groups of food items for each monthly per capita expenditure class	S-35 to S-68
Table (3) :	Percentage (0.00) distribution of calorie intake per consumer unit per diem over different food groups, average intake of calorie, protien and fat per consumer unit per diem by per consumer unit per diem calorie intake classes	S-69 to S-90
Table (4) :	Per 1000 distribution of households by calorie intake level for each monthly per capita expenditure classes	S-91 to S-124
Table (5) :	Per 1000 distribution of persons by calorie intake level for each monthly per capita expenditure classes	S-125 to S-158
Table (6) :	Per 1000 distribution of households over adjusted per diem per consumer unit calorie intake level by reported per diem per consumer unit calorie intake level	S-159 to S-180
Table (7) :	Average number of meals consumed by members per households at home, away from home - i) free from school, balwadi etc., from employer as perquisite or part of wage & others and ii) on payment, during a period of 30 days for each monthly per capita expenditure class	S-181 to S-214

Note: Tables are presented for each state and union territory of India, separately for rural and urban areas. States appear alphabetically first, followed by union territories, and finally by the all-India table.

Survey Results on Participation of Indian Women in Household Work and Other Specified Activities- NSS 50th Round (July 1993-June 1994)

LIST OF DETAILED TABLES

Table No.	Description	Page No.
Table 92 :	Distribution of females usually engaged in domestic duties (92 & 93) in the principal status by reason for attachment to domestic duties for each age-group	S-266 to S-266
Table 93 :	Number of females usually (principal status) engaged in domestic duties (92 & 93) and carrying out specified activities per 1000 females engaged in domestic duties (92-93) by household social group	S-267 to S-270
Table 94 :	Distribution of females of age 15 years & above usually engaged in domestic duties (92 & 93) and willing to accept work at the household by marital status and nature of work acceptable for each type of work acceptable and the number of females willing to accept work per 1000 females (92 & 93)	S-271 to S-272
Table 95 :	Distribution of females of age 15 years & above usually engaged in domestic duties (92 & 93) and willing to accept work at the household per 1000 females (92 & 93) and the number of females having the required skill per 1000 females willing to accept the specified work at the household by age-group and type of work acceptable.	S-273 to S-278
Table 96 :	Distribution of females of age 15 years and above usually engaged in domestic duties (92 & 93) and willing to accept work at the household by type of assistance required for each type of work acceptable.	S-279 to S-284

Survey Results on Economic Activities and School Attendance by Children of India-NSS 50th Round (July 1993-June 1994)

LIST OF DETAILED TABLES

Table No.	Description	Page No.
Table 83 :	Distribution of children working by type of activity for each school attendance status and broad age group by social group	S-285 to S-308
Table 84 :	Distribution of children of age 5-14 years by status of school attendance and work for broad age group and household social group	S-309 to S-314
Table 85 :	Distribution of children of age 5-14 years by status of school attendance and work for each household mpce	S-315 to S-320
Table 86 :	Distribution of children (5-14 yrs.) working in manufacturing and building & construction by process in which working by broad age-group and number of children working in manufacturing and building & construction per 1000 working children	S-321 to S-322
Table 87 :	Distribution of children (5-14 yrs.) working by reason for working for each mpce class	S-323 to S-328
Table 88 :	Proportion (per thousand) of working children (5-14 yrs.) by effect on studies and schooling by type of activity	S-329 to S-331
Table 89 :	Proportion (per thousand) of working children (5-14 yrs.) by effect on studies and schooling by mpce class	S-332 to S-337
Table 90 :	Distribution of children (5-14 yrs.) by reason for not currently attending school for each mpce class	S-338 to S-343
Table 91 :	Distribution of children (5-14 yrs.) not currently attending and seeking/available for work by reason for seeking/available for work for children dropped out and never attended	S-344 to 345

TABLE (83) : PER THOUSAND DISTRIBUTION OF CHILDREN WORKING BY TYPE OF ACTIVITY FOR EACH SCHOOL ATTENDANCE STATUS AND BROAD AGE GROUP BY SOCIAL GROUP

The nutrient content for each item per unit quantity (as specified in the scheduls are shown in the above table.

For some items having a heterogeneous food content, the value of consumption, rather than the quantity, has been preferred as an indicator of the nutrient contents. For such items the unit has been shown as 'Re'. That is, for the items against which the entry in col.3 is 'Re', the quantities of nutrients shown in cols.4, 5 and 6 for the items are available per rupee only and these, multiplied by the value of consumption, will provide the total quantities of nutrients derived from that item.

भारत में पोषण अन्तर्ग्रहण-५०वां दौर (जु. ९३-जून ९४) सर्वेक्षण निष्कर्ष

४.० पौष्टिकों के ग्रहण का स्तर जनसंख्या के वर्ग अथवा श्रेणी के लिए भिन्न-भिन्न है तथा यह अवलोकन अधीन एकत्र किए गए जीवन स्तरों का एक संकेतक है। परिवारिक उपभोक्ता व्यय संबंधी आंकड़े विशेष प्रकार के संकेतकों के निर्माण में सहायता करते हैं जो देश के विभिन्न क्षेत्रों तथा राज्यों से संबंधित जनसंख्या के अनुसार रखे गए जीवन मानकों की कोटि के मूल्यांकन में लाभप्रद हैं। मौजूदा रिपोर्ट में हम इस पहलू पर आंकड़ों द्वारा स्पष्ट किए गए मामले पर संकेन्द्रित होंगे। "पौष्टिकों के ग्रहण" के अनुमानित मूल्यों अर्थात् (क) प्रोटीन (ख) चर्बी ग्राम में (ग) कैलोरी कि० कैलोरी में तथा ऊर्जा की दवाईयों की संख्या तथा विभिन्न साध्य समूहों से प्राप्त की गई पौष्टिकों की मात्रा, जैसा भी मामला हो, राज्यों के ग्रामीण तथा शहरी दोनों क्षेत्रों तथा भारत के लिए आरम्भ से प्रस्तुत किए गए हैं। प्रत्येक राज्य तथा क्षेत्र के लिए निकाले गए विभिन्न कैलोरी ग्रहण स्तरों के लिए मासिक प्रति व्यक्ति व्यय श्रेणी के अनुसार परिवारों और व्यक्तियों के वितरणों पर आगे चर्चा की गई है। सन्दर्भ अवधि के दौरान उपयुक्त भोजनों की कुल संख्या के दो घटकों (१) घर से दूर लिया गया भोजन-निःशुल्क अथवा भुगतान पर और (२) परिवार द्वारा मेहमानों और कर्मचारियों को दिए गए भोजन का केवल घर पर उपयुक्त भोजनों पर आधारित कैलोरी ग्रहण के अनुमान पर सीधे प्रभाव पड़ता है। कैलोरी के वास्तविक ग्रहण के समीप अनुमान का समायोजन कारक द्वारा प्रारम्भिक ग्रहण का संशोधन करके जांच की गई है; इसके लागू करने की पद्धति के ब्यौरों पर भी इस टिप्पणी में चर्चा की गई है। अन्त में इस दौर के परिणामों मौजूदा प्रवृत्ति तथा संगति की जांच के लिए १० प्र० सर्वे के पूर्व दौरों के साथ तुलना की गई है, यदि कोई हो तो।

४.०.१ इस चरण पर यह उल्लेखनीय है कि भारत संघ के सभी राज्यों तथा संघ शासित क्षेत्रों के लिए सर्वेक्षण आंकड़ों की उपलब्धता के बावजूद भी, इस रिपोर्ट में १७ प्रमुख राज्यों अर्थात् (१) आंध्र प्रदेश, (२) असम (३) बिहार (४) गुजरात (५) हरियाणा (६) हिमाचल प्रदेश (७) जम्मू तथा कश्मीर (८) कर्नाटक (९) केरल (१०) मध्य प्रदेश (११) महाराष्ट्र (१२) उड़ीसा (१३) पंजाब (१४) राजस्थान (१५) तमिलनाडु (१६) उत्तर प्रदेश तथा (१७) पश्चिम बंगाल, इस प्रयोजन के लिए विशेष रूप से तैयार किए गए १-७ विवरणों की सहायता से विभिन्न उपर्युक्त पहलुओं पर बाद के पैराग्राफों में की गई चर्चाओं में परिणामों पर ध्यान केन्द्रित किया गया है। भारतीय संघ के सभी राज्यों तथा संघ शासित क्षेत्रों के सम्बन्ध में विस्तृत सारणियां पार्ट-II में प्रस्तुत की गई हैं।

४.१ मासिक प्रति व्यक्ति उपभोक्ता व्यय के अनुसार प्रति दिन कैलोरी, प्रोटीन तथा चर्बी के प्रति व्यक्ति तथा प्रति उपभोक्ता इकाई ग्रहण, क्षेत्रीय तथा अन्तर राज्य तस्वीर।

४.१.१ विवरण-१ प्रति दिन प्रति व्यक्ति तथा प्रति उपभोक्ता कैलोरी, प्रोटीन तथा चर्बी का ग्रहण, कुल उपभोक्ता व्यय के संबंध में भोजन पर व्यय

का प्रतिशत तथा ग्रामीण और शहरी भारत के लिए मासिक प्रति व्यक्ति उपभोक्ता व्यय की १२ श्रेणियों के अनुसार औसत मासिक प्रति व्यक्ति व्यय दर्शाता है। प्रति दिन प्रति उपभोक्ता इकाई कैलोरी, प्रोटीन तथा चर्बी का औसत ग्रहण देश के ग्रामीण क्षेत्रों में क्रमशः २५८३ किलो कैलोरी, ६५.० ग्राम, तथा ३९.१ ग्राम तथा शहरी क्षेत्रों में क्रमशः २५४२ किलो कैलोरी, ७०.२ ग्राम और ५१.६ ग्राम पाया गया। यद्यपि, दोनों क्षेत्रों में कैलोरी का ग्रहण कम पाया गया, प्रोटीन तथा चर्बी स्वपत मानक न्यूनतम अपेक्षाकृत प्रति दिन प्रति उपभोक्ता इकाई का स्तर अधिक था।

इसके अतिरिक्त, कैलोरी और प्रोटीन का अधिक ग्रहण शहरी भारत (२५४२ किलो कै. और ७०.२ ग्राम) की तुलना में ग्रामीण भारत (२६८३ किलो कै. और ७५.० ग्राम) पाया गया। जबकि चर्बी की स्वपत शहरी क्षेत्रों की स्वपत (५१.६ ग्राम) की तुलना में ग्रामीण क्षेत्रों में अपेक्षाकृत कम पायी गई।

४.१.२ विवरण-२ प्रत्येक चरण की ग्रामीण तथा शहरी जनसंख्या दोनों के लिए प्रतिदिन कैलोरी, प्रोटीन तथा चर्बी का प्रति व्यक्ति तथा प्रति उपभोक्ता इकाई ग्रहण दर्शाता है। कैलोरी, प्रोटीन तथा चर्बी के प्रति उपभोक्ता ग्रहण में महत्वपूर्ण अन्तर राज्य भिन्नता दोनों क्षेत्रों में से प्रत्येक में देखी गई।

४.१.३ कुछेक राज्य जहां ग्रामीण क्षेत्रों में प्रति उपभोक्ता प्रति दिन कैलोरी की औसत महत्वपूर्ण रूप से अधिक थी, वे जम्मू तथा कश्मीर (३१५४) हरियाणा (३१०९), राजस्थान (३०९०) और पंजाब (३००७) थे तथा शहरी क्षेत्रों में जम्मू तथा कश्मीर (२९५०), हिमाचल प्रदेश (२९१४), उड़ीसा (२७५४) और राजस्थान (२७०४) थे। दूसरी ओर, ग्रामीण क्षेत्रों में तमिलनाडु (२३४७) और असम (२४०६) तथा शहरी क्षेत्रों में तमिलनाडु (२३६६), महाराष्ट्र (२४३२), केरल (२४४५) और आंध्र प्रदेश (२४५५) में भारतीय औसत की अपेक्षा कैलोरी का ग्रहण काफी कम पाया गया।

४.२.१ विवरण-३ में प्रस्तुत किए गए ग्रामीण और शहरी भारत के लिए मासिक प्रति व्यक्ति व्यय श्रेणी के अनुसार भोजन की विभिन्न मदों से प्रोटीन लेने का प्रतिशत और अनाज और अनाज के विकल्प से कैलोरी लेने का प्रतिशत दिखाया गया है। यह महसूस किया गया कि पौष्टिकता का प्रमुख भाग अनाज से किया गया था। राष्ट्र स्तर पर, कुल कैलोरी में से ७१ प्रतिशत से भी अधिक ग्रामीण क्षेत्र में और ५८ प्रतिशत शहरी क्षेत्र में केवल अनाज से ही प्राप्त होती थी।

४.२.२ देश में अनाज से किए जाने वाले प्रोटीन का औसत ६९ प्रतिशत से भी अधिक ग्रामीण क्षेत्र में और ५९ प्रतिशत शहरी क्षेत्र में पाये गए। यह अनुपात दोनों ग्रामीण और शहरी क्षेत्रों में प्रति व्यक्ति व्यय स्तर

विवरण १: प्रति दिन कैलोरी, प्रोटीन तथा चर्बी का प्रति व्यक्ति तथा प्रति उपभोक्ता इकाई ग्रहण, कुल उपभोक्ता व्यय के संबंध में भोजन पर व्यय का प्रतिशत (०.००) और मासिक प्रति व्यक्ति व्यय श्रेणियों के अनुसार औसत मासिक प्रति व्यक्ति व्यय

के बढ़ने से तेजी से गिरी। यद्यपि अन्य श्रेणी के भोजन समूह से कुल किए जाने वाले प्रोटीन का औसत से एक विपरीत प्रवृत्ति अर्थात् अनुपात दोनों ग्रामीण और शहरी क्षेत्रों के लिए प्रति व्यक्ति व्यय के बढ़ने से निरन्तर बढ़ा है।

४.२.३ पौष्टिकता के रूप में, प्रोटीन अधिकतर अनाज से प्राप्त हुआ। प्रोटीन के स्रोत के रूप में दालें ग्रामीण भारत में दुग्ध और दुग्ध उत्पाद और मांस मछली और अण्डे, अनाज से दूसरे नम्बर का है जबकि शहरी भारत में भोजन समूह "दुग्ध और दुग्ध उत्पाद" के अंशदान का अनुपात दालों (दुग्ध और दुग्ध उत्पाद से औसत अधिक अंश वाले) और मांस, मछली और अण्डा अधिकतम थे।

४.२.४ सभी राज्यों के लिए विभिन्न समूह की भोजन मदों से पौष्टिकता (चर्बी/वसा को छोड़ कर) लेने का प्रतिशत विवरण ४ में दर्शाया गया है।

४.४ प्रत्येक कैलोरी अन्तर्ग्रहण स्तर के लिए मासिक प्रति व्यक्ति व्यय (एम पी सी ई) श्रेणी के अनुसार परिवारों का वितरण: क्षेत्र संबंधी और राष्ट्रीय स्तर पर।

४.४.१ अध्याय तीन में यह बताया गया था कि कैलोरी अन्तर्ग्रहण स्तर को प्रति उपभोक्ता इकाई प्रति दिन २७०० किलो कै. की आवश्यकता "मानक" के प्रतिशत के रूप में माना गया है। आठ प्रति उपभोक्ता इकाई कैलोरी अन्तर्ग्रहण-स्तर अनुमानित वितरण प्रस्तुत करने के लिए बनाया गया है। प्रतिदिन प्रति उपभोक्ता इकाई कैलोरी अन्तर्ग्रहण स्तर द्वारा अनुमानित व्यक्ति और परिवारों के वितरण में, प्रस्तुत कैलोरी अन्तर्ग्रहण स्तर की इकाई "इफो फैंक्टो" मानक का प्रतिशत की कैलोरी नहीं है। कैलोरी अन्तर्ग्रहण स्तर एक्स-वाई में विवरण ६, ७, ८, ९, १०, ११, और १२ में एक्स-वाई का स्पष्टीकरण २७०० किलो से एक्स प्रतिशत से २७०० किलो कै. वाई प्रतिशत तक प्रति उपभोक्ता इकाई कैलोरी अन्तर्ग्रहण प्रति दिन की परिधि के लिए है।

४.४.२ विवरण ४ राष्ट्रीय स्तर पर ग्रामीण और शहरी के लिए प्रत्येक कैलोरी अन्तर्ग्रहण स्तर के लिए एम पी सी ई श्रेणी द्वारा परिवारों का प्रति १००० वितरण प्रदर्शित करती है। विवरण से यह देखा जा सकता है कि निम्न-कैलोरी अन्तर्ग्रहण स्तर वाले परिवार निम्न एम पी सी ई श्रेणियों में एकत्र होने के लिए अपेक्षित है और उच्च कैलोरी स्तर वाले परिवार उच्च एम पी सी ई श्रेणियों में केन्द्रित हैं। ७०-८० के निम्न कैलोरी अन्तर्ग्रहण स्तर वाले परिवार शहरी-क्षेत्रों में १९०-३१० रु और-ग्रामीण क्षेत्र में १४०-१६० में की निम्न एम.पी.सी.आई श्रेणी में केन्द्रित पाये गए थे, जबकि १२०-१५० के उच्च कैलोरी अन्तर्ग्रहण स्तर वाले परिवार शहरी क्षेत्र में ४९०-८५५ रु. और ग्रामीण क्षेत्र में ३००-४५५ रु. के उच्च एम पी सी ई श्रेणी में केन्द्रित पाये गये।

४.४.३ परिवारों के वितरण की अन्तर्राज्यीय तुलना चार एम पी सी ई श्रेणियों के सम्बन्ध में की गई है।

मासिक प्रति व्यक्ति व्यय वर्ग अर्थात् १९० रुपये से कम १९०-२६५ रुपये,

२६५-३५५ रुपये तथा ३५५ और इससे अधिक जिन्हें विलय द्वारा तथा कुछ मूलतः सृजित मासिक प्रति व्यक्ति व्यय वर्ग को जिनका अंतिम बिन्दु ग्रामीण और शहरी दोनों में सामान्य है को पुनः समूह बद्ध करके बनाया गया है।

४.५ प्रत्येक कैलोरी ग्रहण स्तर हेतु मासिक प्रति व्यक्ति व्यय द्वारा व्यक्तियों का वितरण: सेक्टरवार, राज्यवार तथा राष्ट्रीय स्तर।

४.५.१ विवरण ५ ग्रामीण और शहरी शहरी क्षेत्रों में आठ कैलोरी ग्रहण स्तर में से प्रत्येक हेतु प्रति १००० व्यक्तियों में से आबंटन दर्शाती है। व्यक्तियों हेतु सम्मिलित पैटर्न लगभग परिवारों के समान ही है।

४.६ प्रत्येक मासिक प्रति व्यक्ति व्यय वर्ग हेतु कैलोरी ग्रहण स्तर द्वारा परिवारों तथा व्यक्तियों का वितरण: राष्ट्रीय: सेक्टर वार:

४.६.१ विवरण ६ भारतीय जनसंख्या के दोनों क्षेत्रों में प्रत्येक मासिक प्रति व्यक्ति व्यय हेतु कैलोरी ग्रहण स्तर द्वारा परिवारों और व्यक्तियों का प्रति हजार पर विवरण दर्शाती है।

४.६.२ विवरण से यह पाया गया है कि ग्रामीण परिवारों का ३७ प्रतिशत जो ग्रामीण जनसंख्या का ४२ प्रतिशत बनता है, २७०० कैलोरी प्रति उपभोक्ता यूनिट प्रति दिन के अपेक्षित स्तर से "९० प्रतिशत कम" है, जबकि शहरी परिवार के ४२ प्रतिशत जो शहरी जनसंख्या का ४९ प्रतिशत बनता है का कैलोरी ग्रहण का स्तर भी वही रहा।

४.६.३ "९०-११० प्रतिशत" (२७०० किलो कै. = १० प्रतिशत उतार-चढ़ाव) के कैलोरी ग्रहण स्तर से संबंधित परिवारों की कुल जनसंख्या ग्रामीण और शहरी दोनों क्षेत्रों हेतु का लगभग २८ प्रतिशत है जैसा कि मासिक प्रति व्यक्ति व्यय वर्गों से संबंधित आंकड़ों से जाहिर है। "९० प्रतिशत से कम" कैलोरी ग्रहण स्तर हेतु परिवार और जनसंख्या का १००० पर वितरण मासिक प्रति व्यक्ति व्यय वर्गों की वृद्धि के साथ-साथ कम हुआ है। "११० प्रतिशत और इससे अधिक के कैलोरी ग्रहण स्तर में तस्वीर इसके विपरीत पाई गई है। ग्रामीण और शहरी के दोनों क्षेत्रों के लिए यही आभास पाया गया है।"

४.६.४ यह देखा गया है कि उच्चतर ग्रहण स्तर में व्यक्तियों की संख्या से इसमें परिवारों की संख्या संगत रूप से कम है। निम्नतर कैलोरी ग्रहण स्तर में इसके विपरीत आभास है, जो कि संभावित है।

४.७ प्रति परिवार घर पर/घर से दूर-नि.शुल्क/भुगतान पर-उपयोग में लाए गए भोजनों की संख्या अतिथियों और गैर-सदस्य कर्मचारियों द्वारा प्रति १००० परिवारों पर उपभोग में लाए गए भोजनों की संख्या: अन्तर्राज्यीय, सेक्टर वार स्थिति।

४.७.१ विवरण १० में प्रति परिवार घर पर और घर से दूर उपभोग में लाए गए भोजनों की औसत संख्या और अतिथियों और गैर-सदस्य कर्मचारियों द्वारा प्रति १००० परिवारों पर उपभोग किए गए भोजनों की औसत संख्या के बारे में भारत की जनसंख्या के दोनों क्षेत्रों के लिए राज्यवार आंकड़े दिए गए हैं।

विवरण - ३ : मासिक प्रति व्यक्ति व्यय श्रेणी विभिन्न समूह के भोजन मदों से प्रोटोन और कैलोरी लेने का प्रतिशत (०.००)

४.७.२ ग्रामीण क्षेत्र में, यह देखा गया है कि संदर्भ अवधि के दौरान प्रति परिवार उपभोग में लाये गए भोजनों की कुल संख्या गुजरात में ३२७ और जम्मू और कश्मीर में ४६९ है जब कि तदनुसूची राष्ट्रीय आंकड़ा ३५७ है। यह भी देखा गया है कि संदर्भ अवधि के दौरान प्रति परिवार ४०० से अधिक भोजनों का उपभोग जम्मू और कश्मीर (४६९), पंजाब (४५२), हरियाणा (४२०) में किया जाता है जबकि संदर्भ अवधि के दौरान प्रति परिवार ३३५ से कम भोजनों का उपभोग बिहार (३३२), पश्चिम बंगाल (३३०) और गुजरात में होता है। ऐसे राज्य जहां संदर्भ अवधि के दौरान प्रति परिवार भोजनों का उपभोग राष्ट्रीय मानक के बराबर है, वे असम (३५६) मध्य प्रदेश (३५३), आंध्र प्रदेश (३४९), हिमाचल प्रदेश (३४८) और उड़ीसा (३६७) तथा उत्तर प्रदेश (३६८) में हैं।

४.७.३ यह भी देखा गया है कि ग्रामीण भारत में प्रति परिवार संदर्भ अवधि के दौरान उपभोग में लाए गए भोजनों की औसत संख्या लगभग ७३ है। तदनुसूची राज्य औसत ६५ (गुजरात) से ८७ (पंजाब) के बीच रही है। भोजनों की प्रति व्यक्ति खपत के संदर्भ में, ऊपर के ५ राज्यों में पंजाब (८७), तमिलनाडु (८६), आंध्र प्रदेश (८४), केरल (८३) और जम्मू और कश्मीर (८३) है जब कि निम्न स्तर के तीन राज्य गुजरात (६५) पश्चिम बंगाल (६६) और बिहार (६७) है।

४.७.४ ग्रामीण क्षेत्र में, यह देखा गया है कि अधिकांश राज्यों में कुल भोजन का लगभग ९५ प्रतिशत परिवारों द्वारा घर पर लिया जाता है। राज्यों में, केरल में ३ प्रतिशत से अधिक और तमिलनाडु में ५ प्रतिशत से अधिक भोजन परिवार के सदस्यों द्वारा घर के बाहर उपभोग किया जाता है। शेष राज्यों में घर से दूर भोजन के उपभोग का प्रतिशत २ प्रतिशत से कम या बराबर है। यह पाया गया है कि केरल और तमिलनाडु को छोड़ कर सभी राज्यों

विवरण ६: मासिक प्रति व्यक्ति व्यय वर्ग हेतु कैलोरी ग्रहण स्तर के अनुसार परिवार और व्यक्तियों का प्रति हजार पर वितरण।

भारत: ग्रामीण

प्रतिदर्श गांवों की सं. ४६५०

में ०.५ प्रतिशत से भी कम भोजन का उपभोग घर से दूर भुगतान पर किया जाता है।

४.७.५ शहरी क्षेत्र में, संदर्भ अवधि के दौरान परिवार द्वारा राष्ट्रीय स्तर पर उपभोग किए गए भोजनों की औसत संख्या ३१२ है और तदनुसूची आंकड़ा प्रति परिवार लगभग ७० है। जब कि लगभग ९६ प्रतिशत भोजन घर पर ही उपभोग किए जाते हैं और शेष ४ प्रतिशत का उपभोग सदस्यों द्वारा घर से दूर किया जाता है शहरी परिवार द्वारा उपभोग किए गए भोजनों की औसत संख्या २४७ (हिमाचल प्रदेश और पश्चिम बंगाल) से ३८८ (पंजाब) के बीच है। प्रति परिवार भोजन का अपेक्षाकृत न्यूनतम उपभोग गुजरात (२८२) महाराष्ट्र (२८६) और असम (२९५) है। प्रति परिवार कुल भोजनों का अधिकतम उपभोग पंजाब राज्य में देखा गया है और इसके बाद जम्मू और कश्मीर (३८३), केरल (३५४) और उत्तर प्रदेश (३४८) का स्थान है।

४.७.६ शहरी क्षेत्रों में प्रति व्यक्ति उपभोग में लिए गए भोजनों की कुल संख्या ६१ (पश्चिम बंगाल) से ८७ (पंजाब) के बीच रही है। यह भी ध्यान दिया गया है कि ५ प्रतिशत अथवा इससे अधिक भोजनों का उपभोग परिवारों द्वारा घर से दूर किया जाता है। जो हिमाचल प्रदेश (८ प्रतिशत) केरल (५ प्रतिशत) और तमिलनाडु (७ प्रतिशत) है। यह भी देखा गया है कि तमिलनाडु, केरल और हिमाचल प्रदेश राज्यों में प्रति व्यक्ति भोजनों की अधिकतम संख्या परिवार के सदस्यों द्वारा घर से बाहर रहते हुए ली है। इस

कारक को सम्भवतया ऐसे समझा जा सकता है कि शहरीकरण तथा अन्य सामाजिक कारक जैसे प्रमाणित स्रोतों से निःशुल्क भोजन की आसान और सुविधाजनक उपलब्धता इसके लिए उत्तरदायी है। यह भी देखा गया है कि ३० दिनों की संदर्भ अवधि के दौरान घर से दूर रहते हुए अपेक्षाकृत अधिक भोजनों का भुगतान पर उपभोग हिमाचल प्रदेश (११) और केरल (९) राज्यों में अधिक है जब कि तदनुसूची समस्त भारत स्तर पर औसत ४ है।

४.७.७ विवरण ७ जिसमें अतिथियों और गैरसदस्य कर्मचारियों द्वारा किए गए भोजन के उपभोग की औसत संख्या दर्शायी गई है, यह भी दर्शाता है कि ३० दिन की संदर्भ अवधि के दौरान समस्त भारत स्तर पर प्रति परिवार लगभग ३.३ भोजन ग्रामीण भारत में गैर पारिवारिक सदस्यों द्वारा उपभोग किए जाते हैं और लगभग १.९ भोजन प्रति परिवार शहरी भारत में उपभोग किए जाते हैं। यह ग्रामीण क्षेत्रों में प्रति परिवार प्रति दिन लगभग ०.१ भोजन है और शहरी क्षेत्रों में इससे भी कम है। प्रति दिन प्रति उपभोक्ता इकाई कैलोरी अन्तर्ग्रहण स्तर का अध्ययन करने में इस संघटक के प्रभाव के तदुपश्चात विश्लेषण के लिए ध्यान में रखा गया है।

४.७.८ यह देखा गया है कि उपभोग किए गए भोजनों की संख्या में गैर सदस्य कर्मचारियों का भाग दोनों क्षेत्रों में ५ प्रतिशत है लेकिन समारोह के दौरान अतिथियों द्वारा किए गए उपभोग का भाग शहरी भागों की अपेक्षा ग्रामीण भागों में अधिक है।

भारत में पारिवारिक आय के स्रोत रा.प्र.सर्वे.

५०वां दौर (१९९३-९४)

निष्कर्षों का सार

ये निष्कर्ष पारिवारिक उपभोगकर्ता व्यय अनुसूची में सम्मिलित आठ प्रश्नों पर आधारित है वे हैं: क्या परिवार को पिछले ३६५ दिनों के दौरान १. खेती २. मछली पकड़ना तथा अन्य कृषि उद्यमों? ३. मजदूरी/वेतनभोगी रोजगार? ४. गैर-कृषि उद्यम? ५. पेंशन? ६. प्रेषित राशि ७. ब्याज तथा लाभांश ८. अन्य स्रोतों? से कोई आय प्राप्त हुई?

प्रत्येक आठ स्रोतों के लिए, स्रोतों से आय की रिपोर्ट देने वाले परिवारों की प्रतिशतता क्षेत्र, राज्य/संघ शासित क्षेत्र? पारिवारिक किस्म तथा पारिवारिक सामाजिक समूह के अनुसार सारणीबद्ध की गई थी तथा परिणाम सारणी १ आर तथा १ यू, सर्वेक्षण परिणामों में प्रस्तुत किए गए हैं।

समस्त-भारत स्तर पर प्रवृत्तियां: सभी सामाजिक समूह शहरी

१. सबसे महत्वपूर्ण अग्रिम आय "ब्याज तथा लाभांशों" में देखी गई है, जिसकी १९८७-८८ में ४४ तुलना में १९९३-९४ में प्रति १००० परिवारों में ७६ परिवारों द्वारा रिपोर्ट की गई है। सारणी टी-२ दर्शाती है कि दोनों प्रमुख शहरी परिवारों की किरमो "स्वत. नियुक्त" और "नियमित मजदूरी-वेतन अर्जित"-ने इस वृद्धि में योगदान दिया है, परन्तु "अनियमित श्रमिक" परिवारों ने नहीं।

२. पेंशन (४.२ से ५ प्रतिशत तक) और प्रेषणों से (८.१ से ८.८ प्रतिशत तक) आय की रिपोर्ट दे रहे परिवारों की प्रतिशतता में मामूली

सारणी टी-१: विभिन्न स्रोतों से आय की प्राप्ति की रिपोर्ट दे रहे परिवारों के अनुपात में प्रवृत्तियां

खेती	८५	८०
मछली पकड़ना तथा अन्य कृषि उद्यम	४९	५०
मजदूरी/वेतनभोगी रोजगार	६२६	६२६
गैर-कृषि उद्यम	३४३	३४७?
पेंशन	४२	५०
प्रेषित राशि	८१	८८
ब्याज तथा लाभांश	४४	७६
अन्य स्रोत	१०७	१०७
ग्रामीण		
खेती	६२४	६०५
मछली पकड़ना तथा अन्य कृषि उद्यम	१९७	१९५
मजदूरी/वेतनभोगी रोजगार	५६७	५६५
गैर-कृषि उद्यम	१८१	१८३
पेंशन	२३	२५
प्रेषित राशि	८२	७९
ब्याज तथा लाभांश	११	२५
अन्य स्रोत	९५	९०

सी वृद्धि देखी गई है। खेती से आय की रिपोर्ट देने वाले शहरी परिवारों का प्रतिशत ८५ प्रतिशत से ८० प्रतिशत गिर गया है, यह गिरावट अनियत श्रमिक परिवारों के लिए सबसे अधिक रही।

३ "मजदूरी/वेतनभोगी रोजगार" "गैर-कृषि उद्यम", सहित आय के सभी अन्य स्रोतों के लिए आय की रिपोर्ट दे रहे परिवारों के प्रतिशत में परिवर्तन शून्य अथवा नगण्य है।

ग्रामीण

१. इसके बाद सबसे अधिक परिवर्तन ब्याज तथा लाभांशों से आय की रिपोर्ट देने की प्रतिशतता में देखा गया है, जो "सभी परिवारों तथा दो "स्वतः नियुक्त" श्रेणियों में दुगुने से अधिक (११ से २५ प्रतिशत) हो गया है। तथापि, यह अनुपात कृषि श्रमिक (४ प्रति हजार) के लिए वही रहा और अन्य श्रमिकों के लिए (१८ से ७ प्रति १००) गिर गया है।"

२. खेती से आय की रिपोर्ट देने का प्रतिशत लगभग २ प्रतिशत स्तर तक गिर गया है। सारणी टी-२ दर्शाती है कि "कृषि में स्वतः नियुक्त" की अपेक्षा पारिवारिक किस्मों में गिरावट तीव्रतर रही है तथा "अन्य श्रमिक" परिवारों के लिए गिरावट तीव्रतर (३७ प्रतिशत के १९८७-८८ स्तर से लगभग ४ प्रतिशत बिन्दु) रही।

ग्रामीण क्षेत्रों में मासिक समूहों में भिन्नता का पैटर्न

सारणी टी-३, समस्त भारत स्तर पर आय के विभिन्न स्रोतों के महत्व में सामाजिक समूहों में बुनियादी अंतर प्रकाशित करती है और यह देखने का प्रयत्न करती है कि क्या ये अन्तर विभिन्न पारिवारिक किस्मों के लिए एक ही तरह के हैं। निम्नलिखित निष्कर्ष निकाले जा सकते हैं।

१. उन परिवारों में, जिनका कृषि मुख्य कार्यकलाप नहीं है अर्थात् कृषि में स्वतः नियुक्त परिवारों की अपेक्षा, कृषि की रिपोर्ट देने वाला अनुपात (सहायक कार्यकलाप के रूप में) ३० प्रतिशत से अधिक है तथा समस्त भारत स्तर पर सामाजिक समूह पर ध्यान दिए बिना मछली पकड़ना अथवा अन्य कृषि कार्यकलापों की रिपोर्ट देने वालों का अनुपात १३ प्रतिशत से अधिक है।

२. खेती से (४५.९ प्रतिशत) आय की रिपोर्ट देने वाले अनुसूचित जातियों के परिवारों का अनुपात सभी सामाजिक समूहों (सारणी की सबसे नीचे की दो पंक्तियाँ) के लिए औसत (६०.५ प्रतिशत) से कम है। सहायक कार्यकलाप के रूप में, अर्थात् कृषि में स्वतः-नियुक्त परिवारों को छोड़कर परिवार, अन्य समूहों द्वारा की अपेक्षा अनुसूचित जातियों के परिवारों द्वारा खेती की कम रिपोर्ट (अनुसूचित जातियों के कृषि श्रमिकों के परिवारों के ३५.७ प्रतिशत ने सभी सामाजिक समूहों के लिए ४२.४ की तुलना में खेती से आय की दी गई रिपोर्ट) दी गई है।

३. दूसरी ओर, खेती से आय की रिपोर्ट देने वाले अनुसूचित जनजातियों के परिवारों का अनुपात (६८.५ प्रतिशत) सभी सामाजिक समूहों के अनुपात

की तुलना में ८ प्रतिशत बिन्दु उच्चतर है। यह रुचिकर है कि आर्थिक कार्यकलाप के रूप में खेती का अनुसरण कर रहे पारिवारिक किस्मों में से तीन अनुसूचित जनजातियों में से, खेती की रिपोर्ट देने वालों का प्रतिशत बहुत अधिक ५२-५३ प्रतिशत है।

४. मछली पकड़ना तथा अन्य कृषि कार्यकलापों से आय की रिपोर्ट देने वालों का प्रतिशत अनुसूचित जातियों तथा अनुसूचित जनजातियों के परिवारों में राष्ट्रीय औसत की अपेक्षाकृत कुछ कम है लेकिन यह अंतर प्रत्येक पारिवारिक किस्म में एक समान मौजूद नहीं है।

५. अनुसूचित जाति समूह के लिए मजदूरी वेतनभोगी रोजगार से आय की रिपोर्ट देने में अनुपात अधिक है, जो कि ग्रामीण भारत में कृषि श्रमिक परिवारों से संबंधित जनसंख्या का एक तिहाई के लिए गिनती करना इस सर्वेक्षण के द्वारा आंकलित है।

६. गैर-कृषि पारिवारिक उद्यमों से आय की रिपोर्ट देने का अनुपात अनुसूचित जातियों के परिवारों (१५ प्रतिशत) और अनुसूचित जनजातियों के परिवारों (१० प्रतिशत) का अनुपात राष्ट्रीय औसत (१८ प्रतिशत) से कम है। इसी प्रकार का अंतर अधिकांश पारिवारिक किस्मों में देखा गया है।

विभिन्न स्रोतों से आय की रिपोर्ट देने वाले अनुपात में अंतर-राज्यीय भिन्नता

१. खेती से आय की रिपोर्ट दे रहे ग्रामीण परिवारों का प्रतिशत केरल (जहां बागानों से आय की अन्य कृषि-उद्यमों के अंतर्गत रिपोर्ट दी गई थी), तमिलनाडु और पंजाब को छोड़कर जहां ४० प्रतिशत से कम था, सभी प्रमुख राज्यों में ५० प्रतिशत से ८० प्रतिशत तक था।

२. मछली पकड़ना तथा अन्य कृषि उद्यमों (खेती को छोड़कर) से आय की रिपोर्ट केरल में ग्रामीण परिवारों के ६१ प्रतिशत द्वारा, राजस्थान में ३६ प्रतिशत, पंजाब और गुजरात में २८-२९ प्रतिशत और बिहार (५ प्रतिशत), मध्य प्रदेश (८ प्रतिशत) और उड़ीसा (११ प्रतिशत) को छोड़कर सभी अन्य प्रमुख राज्यों में १५-२५ प्रतिशत में था।

३. ग्रामीण क्षेत्रों में गैर-कृषि उद्यमों से आय की रिपोर्ट पश्चिम बंगाल में २९ प्रतिशत परिवारों द्वारा और मध्य प्रदेश को छोड़कर, जहां केवल ९ प्रतिशत परिवारों ने इसकी रिपोर्ट दी थी, सभी प्रमुख राज्यों में १३-२३ प्रतिशत परिवारों ने इसकी रिपोर्ट दी। शहरी क्षेत्रों में अंतर-राज्यीय भिन्नता काफी कम थी, प्रतिशतता ८ प्रमुख राज्यों में ३२-३६ प्रतिशत के अंदर था तथा यह स्पष्टतया उत्तर प्रदेश में सर्वाधिक (४६ प्रतिशत) था और इसके बाद पंजाब (४१ प्रतिशत) था।

४. प्रेषित राशि से आय की ग्रामीण परिवारों के ८ प्रतिशत द्वारा तथा देश में शहरी परिवारों के ९ प्रतिशत द्वारा रिपोर्ट दी गई थी। अनुपात ग्रामीण तथा शहरी दोनों क्षेत्रों में केरल के लिए १८ प्रतिशत था, तमिलनाडु में शहरी क्षेत्र के १४ प्रतिशत द्वारा और ग्रामीण क्षेत्र में १२ प्रतिशत द्वारा, उड़ीसा में ११-१२ प्रतिशत और बिहार में ९-१० प्रतिशत द्वारा रिपोर्ट दी गई थी। हरियाणा

और उत्तर प्रदेश में ग्रामीण क्षेत्र का अनुपात शहरी क्षेत्रों की अपेक्षा काफी अधिक था। ग्रामीण तथा शहरी दोनों क्षेत्रों के लिए सभी प्रमुख राज्यों में मध्य प्रदेश में प्रतिशत सबसे कम था।

५. ब्याज अथवा लाभांश से आय की रिपोर्ट गुजरात, पश्चिम बंगाल, महाराष्ट्र और असम में सभी शहरी परिवारों के १३-१४ प्रतिशत द्वारा दी

गई थी परन्तु पंजाब (११ प्रतिशत) को छोड़कर बिहार में केवल (१.४ प्रतिशत) आंध्र प्रदेश और मध्य प्रदेश में २ प्रतिशत और सभी अन्य प्रमुख राज्यों में ३-८ प्रतिशत द्वारा रिपोर्ट दी गई थी।

६. पेंशन से आय की रिपोर्ट दे रहे शहरी परिवारों का अनुपात अधिकांश प्रमुख राज्यों में ४-९ प्रतिशत के अंदर था।

भारतीय महिलाओं की पारिवारिक कार्य और अन्य विनिर्दिष्ट कार्य-कलापों में भागीदारी-

५०वां दौर (जुलाई ९३-जून ९४)

मुख्य निष्कर्ष

४० महिलाओं का एक महत्वपूर्ण वर्ग सामान्यतः घरेलू कार्यों में लगा रहता है तथा घरेलू उद्यमों के कार्यक्रमों में भाग लेती है। वे बहुत सी गतिविधियों में भी भाग लेती हैं। जिसमें उनको पारिवारिक आर्थिक लाभ होता है। महिलाओं की ऐसी भागीदारी कुछ मामलों में जब भागीदारी बहुत कम है या जब किया गया कार्यक्रम एक सीमित आर्थिक कार्यक्रम है— प्रायः रोजगार के संकेत में हमेशा प्रदर्शित नहीं होता है। अतः प्रश्नों की जांच-पड़ताल से अन्यो के साथ जिसमें उनके घरों को लाभ होता है। आर्थिक कार्यक्रमों की बहुत से सीमित मामलों में महिलाओं की भागीदारी पर प्रस्तुत की गई थी। इस उद्देश्य से लिए सर्वेक्षण में विचरित विशिष्ट कार्यक्रम और उन कार्यक्रमों में भागीदारी दर देते हुए परिणाम संपूर्ण रूप से देश के लिए और १६ प्रमुख राज्यों के लिए प्रस्तुत किए गए हैं। परिचर्चाएँ केवल समस्त भारत के संबंध परिणामों तक सीमित हैं।

४१ घरेलू परिसरों, स्वीकार्य कार्य की श्रेणी और प्रकृति, अपेक्षित सहायता की श्रेणी, इत्यादि पर कार्य की उपलब्धता पर प्रश्नों की जांच पड़ताल भी सर्वेक्षण में मांगी गई थी। इस अध्याय में इस विशिष्ट जांच-पड़ताल प्रश्नों के उत्तर पर आधारित कुछ परिणाम भी भारत और प्रमुख राज्यों के ग्रामीण और शहरी क्षेत्रों के लिए अलग से प्रस्तुत किए गए हैं।

४.२ विशिष्ट कार्यक्रमों में महिलाओं की भागीदारी: १९९३-९४ के दौरान, भारत में ग्रामीण महिलाओं का लगभग २९ प्रतिशत और शहरी महिलाओं का लगभग ४२ प्रतिशत प्रायः (मुख्य और सहायक) केवल घरेलू कार्यों में लगी हुई थी जबकि क्रमशः ग्रामीण और शहरी महिलाएं क्रमशः ३३ और १६ प्रतिशत प्रायः कुछ आर्थिक कार्यक्रम चलाती हैं। श्रेणीबद्ध किए गए प्रत्येक व्यक्ति जो अपने प्रमुख स्तर की शर्तों में घरेलू कार्यों में लगे हुए हैं, से यह पूछा गया था कि उन्होंने अपने सामान्य घरेलू कामकाज के साथ-साथ घरेलू खपत के लिए अधिक या कम नियमित रूप से निश्चित विशिष्ट कार्यक्रमों का अनुकरण किया था। प्राप्त उत्तरों को महिलाओं के लिए सारणीबद्ध किया गया है। कार्यक्रमों को तीन विस्तृत श्रेणियों में समूहित किया गया था:-

(१) कृषि उत्पादन से संबंधित कार्यक्रम जैसे कि घरेलू खपत के लिए कृषि उत्पादों का निःशुल्क एकत्रीकरण सहित रसोई बागान का रख-रखाव, घरेलू मुर्गीखाने में काम, डेयरी आदि हैं।

(२) घरेलू खपत के लिए परिवारों द्वारा प्रस्तुत किए गए प्राथमिक उत्पाद का प्रक्रमण और

(३) निजी खपत के लिए अन्य कार्यक्रम लेकिन परिवारों के लिए आर्थिक लाभों के परिणाम।

जैसा कि स्पष्ट किया गया है १, २, ३ और ४ के रूप में सूचीबद्ध कार्यक्रमों आर्थिक कार्यक्रम है। कार्यक्रम ५ से ९ तक समूह (II) के अंतर्गत आते हैं। और एक अंतर्राष्ट्रीय मानक की सिफारिशों के अनुसार आर्थिक रूप में समझा जाना चाहिए। शेष कार्यक्रम (मद १० से १९ तक) समूह के अंतर्गत समझते जाते हैं। (३) तृतीय समूह कार्यक्रम निजी खपत के लिए खरीदे जाते समय किराया नहीं है लेकिन परिवारों के लिए निश्चित रूप से लाभकारी है। यह देखा गया है कि सामान्य रूप से वर्गीकृत की गई वे महिलाएं मुख्य स्तर में घरेलू कार्यों में लगी हुई हैं, अपने घरेलू कामकाज के लिए परिवार खपत सहित ग्रामीण क्षेत्रों में लगभग ६४ प्रतिशत और शहरी क्षेत्रों में लगभग १६ प्रतिशत समूह (I) और (II) के अंतर्गत एक या अधिक कार्यक्रमों का अनुकरण करती हैं। यह भी नोट किया जाए कि उन कार्यक्रमों में लगने वाली कुछ महिलाएं आत्मिक रूप में एक सहायक कार्यक्रमों में कार्य के रूप में और शेष को अपने सहायक स्तर के अनुसार कार्य न करने के रूप में वर्गीकृत किया गया था। महिलाओं का द्वितीय वर्ग क्रमशः ग्रामीण और शहरी भारत में किसी सहायक (स्तर) कार्य के बिना और उनमें से घरेलू कार्यों में संलग्न लगभग ५८ प्रतिशत और १४ प्रतिशत का गठन करती हैं। सभी महिला कामगारों की जनसंख्या के अनुपात को बढ़ा करके (मुख्य और सहायक स्थिति) तथा उपर्युक्त समानुपातों को उनमें जोड़ करके अनुमानित रूप में प्राप्त किया जा सकता है।

४.३ पारिवारिक परिसरों में कार्य करने के लिए महिलाओं की उपलब्धता:

जैसा कि पहले उल्लेख किया गया है, यह नोट कर लिया जाए कि यद्यपि महिलाओं का एक बड़ा भाग कार्य नहीं करता है फिर भी वे स्वयं को रोजगार विहीन रिपोर्ट नहीं करते हैं। उनमें बहुत से लोग अपने घरों के परिसरों से बाहर आकर काम करने के लिए इच्छुक पाए जायेंगे यदि उनके घर के परिसरों में काम उपलब्ध करा दिया जाए। सर्वेक्षण के साथ-साथ विशेष गहराई

सारणी (१): १५ वर्ष और उससे अधिक आयु की महिलाएं साधारणतया पारिवारिक कार्यों से जुड़ी हुई हैं। (मुख्य स्थिति) और प्रति १००० महिलाएं (१५ वर्ष की आयु तथा इससे ऊपर) साधारणतया जो पारिवारिक कार्यों से जुड़ी हुई हैं। पारिवारिक परिसर में वैवाहिक स्थिति के अनुसार कार्य स्वीकार करने की इच्छुक हैं।

भारत

स्वीकार्य कार्य के प्रकार	ग्रामीण			शहरी		
	हाल ही में विवाहित	अन्य	सभी	हाल ही में विवाहित	अन्य	सभी

स्रोत : सारणी ९४

से जांच पड़ताल की गई जिसमें उनके घरों के परिसरों में कार्य उपलब्ध कराने की प्रकृति और स्वीकार्य कार्य की किस्म आदि के संबंध में प्रश्न शामिल किए गए। केवल १५ वर्ष और उससे अधिक आयु की महिलाओं के लिए सुसंगत सूचना तालिकाबद्ध की गई। १५ वर्ष और उससे अधिक आयु की वर्गीकृत महिलाओं का समानुपात तालिका १ में दिया गया है जो कि पारिवारिक कार्यों से जुड़ी हुई हैं और ग्रामीण तथा शहरी भारत में पारिवारिक कर्तव्यों से जुड़ी १५ वर्ष और उससे अधिक आयु की सकल महिलाएं अपने पारिवारिक परिसरों में कार्य करने के लिए इच्छुक हैं। यह देखा गया है कि १५ वर्ष और उससे अधिक आयु की महिलाएं सामान्यतया पारिवारिक कर्तव्यों से जुड़ी हुई होती हैं। अपने घर के परिसरों में कार्य को उपलब्ध कराने के लिए एक अच्छे अनुपात में महिलाओं ने सूचित किया था। (ग्रामीण भारत में ३० प्रतिशत तथा शहरी भारत में २७ प्रतिशत। ग्रामीण तथा शहरी भारत दोनों में (१५+) महिलाओं का १७ प्रतिशत बनता है। ४३वें दौर के परिणाम की भांति ५०वें दौर के आंकड़ों से प्रतीत होता है कि महिलाओं ने दुग्धशाला, कताई और बुनाई तथा सिलाई के कार्य को पसंद किया है।

४.४ स्वीकार्य की प्रकृति : प्रत्येक महिला जिसने अपने पारिवारिक परिसर में एक विशेष प्रकार का कार्य करने के लिए सूचना उपलब्ध कराई है उनसे भी कार्य की प्रकृति के बाबत (अर्थात् नियमित पूर्णकालिक, नियमित

अंशकालिक अथवा केवल अनियमित) जो भी उन्हें स्वीकार्य है, पूछा गया। सारणी २ में ग्रामीण तथा शहरी भारत के लिए सुसंगत परिणाम प्रस्तुत किया गया है। यह देखा गया है कि लगभग ६३ से ६८ प्रतिशत तक की जिन महिलाओं की आयु १५ वर्ष और उससे अधिक है, अपने पारिवारिक परिसरों में नियमित रूप से कार्य करने के लिए केवल अंशकालिक कार्य की उपलब्धता को पसंद किया गया है तथा २७ से ३३ प्रतिशत तक की महिलाओं के नियमित रूप से 'पूर्णकालिक' कार्य को पसंद किया है।

४.५ अपेक्षित सहायता : परिवार में कोई कार्य करने के लिए यदि यह स्व-रोजगार क्षमता में है, वित्त, प्रशिक्षण आदि के रूप में कुछ सहायता आवश्यक रूप से अपेक्षित है। अतः जांच पड़ताल तय करने के प्रश्न को महिलाओं द्वारा अपेक्षित 'सहायता की किस्म' पर पारिवारिक घरों में कार्य उपलब्धता की सूचना को शामिल किया गया। १५ वर्ष और उससे अधिक आयु की महिलाएं जो पारिवारिक कर्तव्यों से मुख्य स्थितियों में जुड़ी हुई हैं तथा सूचित 'कार्य' को लेने के लिए अपेक्षित सहायता से पारिवारिक परिसरों में कार्य करने के इच्छुक हैं, का वर्गीकरण सारणी ३ में दिया गया है। परिणामों से यह प्रकट हुआ है कि घर के परिसरों में कार्य करने की इच्छुक अधिकांश महिलाओं को या तो 'आसान शर्तों पर प्रारंभिक वित्त' अथवा अपनी वांछित गतिविधियों को पूरा करने के लिए 'कार्यशील वित्त सुविधाओं' की आवश्यकता है।

सारणी (२): १५ वर्ष और उससे अधिक आयु तथा प्रत्येक किस्म की ग्राह्य कार्य के लिए स्वीकार्य कार्य की प्रकृति की स्थिति के अनुसार पारिवारिक परिसरों पर कार्य करने को मंजूर करने की इच्छुक प्रति १००० महिलाओं का वितरण।

भारतीय बच्चों द्वारा आर्थिक कार्यकलाप और स्कूल में उपस्थिति

५०वां दौर (१९९३-९४)

मुख्य निष्कर्ष

जैसाकि पहले उल्लेख किया गया है यह अध्याय स्कूल उपस्थिति सहित बच्चों की गतिविधियों की कुछ प्रमुख विशेषताओं की रूपरेखा बताता है। इस सर्वेक्षण में, ५-१४ वर्ष की आयु के बच्चों के लिए विवरण एकत्र किए गए थे। इस आयु समूह में, सर्वेक्षण में ८५ १५२ ग्रामीण बच्चे और ४६०५८ शहरी बच्चे कवर किए गए। ये अनुमान सम्पूर्ण भारत के लिए दिये गये हैं। विभिन्न राज्यों और संघ शासित क्षेत्रों के लिए तदनुसूची अनुमान बहुत से सहसम्बन्धितों हेतु लघु प्रतिदर्श आकार होने के कारण यहां नहीं दिए गए हैं।

१.१ सर्वेक्षण में यह अनुमान किया गया है कि भारतीय जनसंख्या का ३६.१ प्रतिशत १५ वर्ष की आयु वाले बच्चों का था, उनमें से ५-१४ वर्ष की आयु वाले बच्चे ६६ प्रतिशत बनते थे। (५-१४) आयु

१.२ स्कूल उपस्थिति: विवरण:। समस्त भारत स्तर पर स्कूल उपस्थिति के स्तर के अनुसार बच्चों का विवरण देती है:

यह पाया गया है कि लड़कियों को स्कूल में उपस्थिति दर लड़कों के मुकाबले बहुत कम थी इसके आगे यह दर ग्रामीण क्षेत्रों में और भी अधिक थी। जबकि लड़कों में स्कूल उपस्थिति दर ग्रामीण क्षेत्रों में ७० प्रतिशत और भी अधिक थी। जबकि लड़कों में स्कूल उपस्थिति दर ग्रामीण क्षेत्रों में ७० प्रतिशत और शहरी क्षेत्रों में लड़कियां क्रमशः ५५ प्रतिशत और ८० प्रतिशत थी। बच्चों की शिक्षा का दूसरा पहलू स्कूल में छोड़कर चले जाना है। इस सर्वेक्षण के उद्देश्य के लिए, ऐसे बच्चे जिन्होंने कक्षा/स्तर पूरा करने से पहले अपना अध्ययन छोड़ा है वे अन्तिमवार उपस्थित हुए थे, उन्हें बीच में ही छोड़े हुए माना गया था। लड़कियों के

स्रोत: रिपोर्ट सं. ४१२: भारत के बच्चों द्वारा आर्थिक कार्यकलाप और स्कूल में उपस्थिति: रा.प्रति. सर्वे. ५० वां दौर, १९९३-९४

समूह में लड़के (५३ प्रतिशत) लड़कियां (४७ प्रतिशत) से अधिक बच्चे ग्रामीण क्षेत्रों में रहते थे। जबकि बच्चों की गतिविधियों पर जानकारी केवल ५-१४ वर्ष के आयु समूह के लिए एकत्रित की गयी थी, इस अध्याय में परिणाम और निम्नलिखित विचार-विमर्श केवल ५-१४ वर्ष की आयु के बच्चों से सम्बन्धित थी (जिसे बाद में बच्चों के रूप में संदीर्भित किया गया है)।

छोड़कर चले जाने की दर लड़कों से अधिक थी और यह ग्रामीण क्षेत्रों में और भी अधिक थी। प्रति १०० लड़कियों में से जिनका स्कूल में नाम दर्ज किया गया था, ग्रामीण भारत में ४२, और शहरी भारत में १८, कक्षा/स्तर छोड़ कर चले गए जिन्होंने अन्तिम रूप से उपस्थित हुए। लड़कों के लिए तदनुसूची संख्या २७ और १४ थी। बच्चों की तीसरी श्रेणी जो किसी स्कूल में उपस्थित नहीं हुए, बच्चों का लगभग २ से ४ प्रतिशत तक था। १६ प्रमुख राज्यों के लिए तदनुसूची वितरण विवरणी १.१ में दिया गया है।

विवरण १.१: प्रमुख राज्यों के लिए स्कूल में उपस्थिति और लिंग के स्तर के अनुसार बच्चों (५-१४ वर्ष) का प्रति १००० वितरण

१.३ स्कूल उपस्थिति-एम पी सी ई के साथ सम्बंध:

विवरण १.२ यह दर्शाता है कि स्कूल उपस्थिति और मासिक प्रति व्यक्ति व्यय (एम पी सी ई) के बीच, जैसा कि अनुमान किया गया था, सकारात्मक सम्बन्ध है। अधिकतर छोड़कर जाने वालों के साथ न्यूनतम उपस्थिति न्यूनतम एम पी सी ई कक्षाओं की विशेषता है। उपस्थिति दर बढ़ती है और जैसे ही एम पी सी ई बढ़ती है, दोनों ग्रामीण और शहरी क्षेत्रों में छोड़ कर जाने वालों की दर धीरे-धीरे घट जाती है। ऐसे बच्चों में जो स्कूल कभी नहीं गए थे एम पी सी ई के साथ विशेष रूप से अनुपात नहीं बदलता, लेकिन जैसे ही एम पी सी ई बढ़ती है इसमें सीमित रूप से नीचे गिरने की प्रवृत्ति थी।

१.४ कामकाजी बच्चे: जैसा कि अध्याय एक में उल्लेख किया गया है, सर्वेक्षण करते समय ३६५ दिनों के दौरान एक बच्चे द्वारा अनुपालित

आर्थिक गतिविधि के आधार पर नित स्तर पहुँच का शक्ति से अनुकरण नहीं किया गया था। इसके अतिरिक्त, एक "तर्कसंगत नियमितता" मापदण्ड आर्थिक गतिविधि में एक बच्चे द्वारा भागीदारी की पहचान के लिए अपनाया गया था। इस पर आधारित ग्रामीण और शहरी भारत के लिए प्राप्त कामकाजी बच्चों का अनुपात विवरण १.३ में प्रस्तुत किया गया है लगभग ७ से ८ प्रतिशत तक ग्रामीण बच्चे और उससे कुछ निम्न श्रेणी, ३ से ४ प्रतिशत तक शहरी बच्चों ने सामान्य तर्कसंगत नियमितता सहित कार्य किया था।

कामकाजी बच्चों ७७ ८९ प्रतिशत तक कार्य से उनके परिवारों को आर्थिक लाभ हुआ था। काम करने की भागीदारी दर में लिंग भिन्नता ग्रामीण और-शहरी क्षेत्रों में महत्वहीन प्रतीत होती है। अर्थात, घरेलू काम-काज में लड़कियों द्वारा सहायता का अनुपात (जिस आर्थिक

विवरण १.३ ५-१४ वर्ष की आयु के बच्चों की संख्या (१) घरेलू काम-काज में सहायता और (११) ५-१४ वर्ष की आयु के प्रति १००० बच्चों का काम और बच्चों की संख्या जिनका कार्य प्रत्येक लिंग के लिए कार्य करते हुए आर्थिक रूप से प्रति १००० बच्चों ने परिवारों में मदद की।

जोड़	१०००	१०००	१०००	१०००

को घरेलू कामकाज और सगे भाई-बहनों की देख भाल का कार्य दिया गया है।

१.६ कामकाजी बच्चों की गतिविधियां: विवरण १.५ में दिया गया परिणाम कामकाजी बच्चों द्वारा की गयी गति विधि की श्रेणी दर्शित करता है। ग्रामीण क्षेत्रों में, कामकाजी बच्चों का एक बड़ा समूह घरेलू उद्योगों और कृषि क्षेत्रों में लगा हुआ था। शहरी क्षेत्रों में दूसरी ओर काम काजी बच्चों के एक समूह ने किराये के श्रमिक के रूप में ओर मुख्यतः गैर-कृषि क्षेत्र में कार्य किया। ग्रामीण क्षेत्र में लगभग ६३ से ६५ प्रतिशत कामकाजी बच्चों ने अपने पारिवारिक उद्योग में कार्य किया, उनमें से ७९ से ८२ प्रतिशत ने पारिवारिक कृषि उद्योगों में कार्य किया। लगभग ३५ से ३७ प्रतिशत ने किराये के श्रमिकों के रूप में कार्य किया। शहरी क्षेत्र में ६० प्रतिशत कामकाजी बच्चों से कुछ कम ने किराये के श्रमिकों के रूप में कार्य किया और शेष ने घरेलू उद्योगों में कार्य किया था। शहरी क्षेत्रों में गैर-कृषि क्षेत्र ने लगभग ८१ से ८६ प्रतिशत कामकाजी बच्चे लगाये।

१.७ जोखिमपूर्ण गतिविधियों में लगे कामकाजी बच्चे: "विनिर्माणकारी और उद्योगों के भवन एवं निर्माण कार्य" प्रक्रिया संबंधी जानकारी में विशिष्ट जोखिम गतिविधियों में लगे कामकाजी बच्चों के लिए जिसमें वे काम कर रहे थे, सर्वेक्षण में एकत्रित की गयी थी। प्राप्त किए गए परिणाम "प्रक्रिया" के अनुसार उनके वितरण और-विनिर्माणकारी तथा उद्योगों के भवन एवं-निर्माण कार्य में लगे कामकाजी बच्चों का अनुपात दर्शाते हुए विवरण १.८ में प्रस्तुत किया गया है। यहां यह भी उल्लेख किया जाए कि इन उद्योगों से सम्बन्धित १४ जोखिमपूर्ण प्रक्रियाएं सर्वेक्षण में जानकारी एकत्र करने के लिए पहचानी गयी थी। सर्वेक्षण में

विनिर्माणकारी और उद्योगों के भवन और निर्माण कार्य करने वाले ग्रामीण क्षेत्र में ३३८ और शहरी क्षेत्र में ३०७, प्रतिदर्श बच्चे ६४५ ही पाए जा सके। उनमें से "प्रक्रिया" जिसमें उन्होंने कार्य किया, ४०८ मामलों में दर्ज नहीं पायी गई थी। सर्वेक्षण में ४ प्रक्रिया में अर्थात: शिलेक विनिर्माण, साबुन विनिर्माण गोमेद से उत्पाद का विनिर्माण, और विषाक्त सामग्री एवं रस का प्रयोग करते हुए विनिर्माणकारी प्रक्रिया में कोई बच्चा लगा हुआ नहीं मिल सका। प्रत्यक्षतः सर्वेक्षण जोखिमपूर्ण गतिविधियों में कामकाजी बच्चों की भागीदारी पर आंकड़े एकत्र करने में समर्थ नहीं हुआ। प्रतिदर्श में बच्चों की संख्या, कुछ प्रक्रियाओं में काम करने वाले भी बहुत कम थे। विवरण १.६ में दिए गए अनुमानों की विश्वसनीयता के बाद में विचार रखने के सम्बन्ध में विभिन्न प्रक्रियाओं में लगे प्रतिदर्श बच्चों की संख्या लघु कोष्ठक में दी गयी है।

१.८ यह देखा गया है कि विनिर्माणकारी और उद्योगों के भवन एवं निर्माण कार्य में लगे कामकाजी बच्चों का अनुपात ग्रामीण क्षेत्रों में लगभग ७ प्रतिशत और शहरी क्षेत्रों में २४ प्रतिशत था। इन उद्योगों में लगे लगभग २६ प्रतिशत लड़के कपड़ा छपाई/रंगाई और बुनाई और ६ प्रतिशत वीडो बनाई में लगे हुए थे। तदनुसारी प्रतिशत शहरी लड़कों के लिए १३ और ४ था।

इन उद्योगों में लगी ग्रामीण लड़कियों के मामले, क्रमशः २३ प्रतिशत और १९ प्रतिशत के मुकाबले लगभग २६ प्रतिशत वीडो बनाने में और १६ प्रतिशत कपड़ा छपाई/रंगाई और बुनाई में लगे थे। जोखिम पूर्ण कार्य में लगे २ से ५ प्रतिशत बच्चे चटाई बुनाई में लगे हुए थे। शेष प्रक्रिया में लगे बच्चों का अनुपात बहुत कम पाया गया था।

विवरण १.६ प्रत्येक लिंग के लिए प्रक्रिया के अनुसार उनके प्रति १००० वितरण और ५-१४ वर्ष की आयु के प्रति १००० कामकाजी बच्चे विनिर्माण और उद्योगों के भवन एवं निर्माण कार्य में लगे ५-१४ वर्ष के बच्चों की संख्या

भारत

प्रक्रिया जिसमें वे काम कर रहे हैं।	ग्रामीण		शहरी	
	लड़के	लड़कियां	लड़के	लड़कियां
विनिर्माण और भवन एवं निर्माण कार्य में लगे बच्चों की संख्या प्रति १००० वितरण	७१ (१६९)	६६ (१६९)	२३९ (१८३)	२४४ (१२४)
बीड़ी बनाना	६२ (९)	२६३ (४०)	३८ (८)	२३१ (३०)
घटाई बनाना	३८ (८)	४९ (११)	२५ (४)	२० (३)

जो रिकार्ड नहीं किए गए	५८८ (११८)	३७५ (८५)	७४३ (१४६)	३९४ (५९)
कुल	१०००	१०००	१०००	१०००

स्रोत: सारणी ८६ नोट: लघु कोष्ठक में दिए आंकड़े उस प्रक्रिया में काम करने वाले प्रतिदर्श बच्चे बताते हैं।

१.९ काम के लिए उपलब्ध/तलाश में लगे बच्चे: कुछ बच्चे जो स्कूल नहीं जा रहे थे और जो काम नहीं करते, कार्य के लिए उपलब्ध/तलाश में लगे हुए थे। लगभग १ से २ प्रतिशत बच्चे जो बीच में स्कूल छोड़कर चले गए थे उनसे १ प्रतिशत कम थे जो कभी स्कूल नहीं गए थे। (दिवें: भाग ११ परिणाम स्कूल की सारणी ९१)। उनमें से एक समूह अपने परिवार की आय बढ़ाने के लिए काम के लिए उपलब्ध/तलाश में लगे हुए थे।

१.१० काम-काज करने का कारण: सारणी १.७ कामकाज करने का कारण के अनुसार कामकाजी बच्चों का वितरण दर्शाती है। काम करने का मुख्य कारण "परिवार की आय को बढ़ाना" था ऐसा ५७ से ६३ प्रतिशत कामकाजी बच्चों द्वारा बताया गया है। लगभग १८ से २० प्रतिशत ग्रामीण क्षेत्रों में कामकाजी बच्चे और ७ से ८ प्रतिशत शहरी क्षेत्रों में यह बताया

गया है "घरेलू उद्यमों में श्रमिकों की कमी" उनके काम करने का कारण है। कामकाजी बच्चों के लिए अन्य कारण ही कम अनुपात में है।

१.११ पढ़ाई पर कार्य प्रभाव: पढ़ाई पर कार्य के प्रभाव के सम्बन्ध में जानकारी उन कामकाजी बच्चों से एकत्रित की गयी थी जो स्कूल भी जा रहे थे। विवरण १.८ में दिए गए सुसंगत परिणामों से यह दर्शित होता है कि लड़कियों से अधिक कामकाजी लड़कों के एक उच्चतर अनुपात को रक-रक या नियमित रूप से स्कूल छोड़ना था और या तो वे गृह कार्य में या फिर टेस्ट/परीक्षा की तैयार करने में असमर्थ थे। बच्चों का अनुपात जो स्कूल छोड़ गए थे या कार्य के कारण पढ़ाई की तैयार करने में असमर्थ थे, शहरी क्षेत्रों के मुकाबले ग्रामीण क्षेत्रों में अधिकतर था।

विवरण: १.७ प्रत्येक लिंग के लिए कामकाज के कारण कामकाजी बच्चों का प्रति १००० वितरण

भारत

कामकाज करने का कारण	ग्रामीण		शहरी	
	लड़के	लड़कियां	लड़के	लड़कियां
परिवारिक आय को बढ़ाना	६००	५७०	६२९	६२७
घरेलू उद्यमों में श्रमिकों की कमी	२०३	१७६	६५	७७
प्राप्त कार्य कुशलता	२८	२६	९९	११
वैयक्तिक खर्चे पूरा करना	१३	१४	३४	१२
खर्च समय	२२	२२	१८	११
ऋण की पुनः अदायगी	१	१	-	-
अन्य	१३२	१९१	१५४	२६२

विवरण: १.८ प्रत्येक लिंग के लिए पढ़ाई पर प्रभाव के बावजूद भी और स्कूल जा रहे बच्चों का (प्रति १०००) अनुपात

भारत

पढ़ाई पर प्रभाव	ग्रामीण		शहरी	
	लड़के	लड़कियां	लड़के	लड़कियां
स्कूल छोड़ गए:				
रक-रक कर	२७९	१५५	८८	४१
नियमित	८०	६८	१६	१०
प्रभावित पढ़ाई				
गृह कार्य करने में असमर्थ	१८२	१५१	४२	३०
टेस्ट/परीक्षा की तैयारी करने में असमर्थ	६९	४९	३६	७३

स्रोत: सारणी ८८

शहरी क्षेत्रों में ५ से १० प्रतिशत कामकाजी बच्चे के मुकाबले ग्रामीण क्षेत्रों में लगभग २२ से ३६ प्रतिशत कामकाजी बच्चे को स्कूल छोड़ना था ग्रामीण क्षेत्र में लगभग २० से २५ प्रतिशत कामकाजी बच्चे और शहरी क्षेत्र में ८ से १० प्रतिशत काम के कारण अपनी पढ़ाई की तैयारी करने में असमर्थ थे।

१.१२ वर्तमान में उपस्थित न रहने के कारण: स्कूल में न जाने के कारण उन बच्चों के लिए निर्धारित किए गए थे जो वर्तमान में स्कूल नहीं जा रहे थे—उनमें से लगभग २१ से ३० प्रतिशत की पढ़ाई में "रुचि

नहीं" की सूचना थी और लगभग १५ से २० प्रतिशत की सूचना थी कि वे पढ़ाई का खर्च नहीं उठा सके। लगभग ६ से १० प्रतिशत बच्चे स्कूल नहीं गए क्योंकि उन्हें "पारिवारिक अर्थ गतिविधि में भागीदारी" या मजदूरी/वेतन के लिए काम करना था। "सगे भाई-बहनों की देखभाल "या" घरेलू काम काज करने के विषय में जबकि अन्य सदस्य काम में लगे थे: १ से २ प्रतिशत लड़कों के मुकाले ३ से ४ प्रतिशत लड़कियां स्कूल जा सकी। १२ से १७ प्रतिशत बच्चों का इतना छोटा होना कि वे स्कूल में नहीं जा सकते" के कारण की सूचना थी।

विवरण १.९: प्रत्येक लिंग के लिए स्कूल न जाने के कारण के अनुसार वर्तमान में स्कूल नहीं जा रहे प्रत्येक लिंग के लिए

भारत

स्कूल जाने का कारण	ग्रामीण		शहरी	
	लड़के	लड़कियां	लड़के	लड़कियां
