A Note on Differences in Level of Consumption Among Socio-economic Group NSS 50th Round (1993-94)

Section 1

Introduction

1.1 The fifth quinquennial NSS survey on consumer expenditure was carried out in 1993-94 as part of the 50th round of NSS. The household consumer expenditure schedule used was canvassed in 115354 households belonging to 6951 villages and 4650 urban blocks.

1.2 The survey ascertained total household expenditure on domestic account for each sample household during the last 30 days and, apart from this, recorded some household particulars including household size, household social group (SC/ST/others), the broad occupational type (self-employed in agriculture, regular wage/salary earning etc.) of the household and, for rural households, the area of household land possessed.

1.3 This information was used to generate the distribution of rural and urban population over different classes of monthly per capita expenditure, separately for persons belonging to specific household types, occupational groups, and land possessed size classes, in different states and union territories of India. These data form the basis of the present note.

1.4 The note thus enables the comparison of per capita consumption (considered not as a

one-dimensional average but as a distribution of persons over different expenditure classes) for different sections of population demarcated by differing socio-economic characteristics.

1.5 Data on the same subject was last presented for 1987-88, based on the fourth consumer expenditure survey of the quinquennial series conducted during that period (Sarvekshana, Vol. XVII, No. 2).

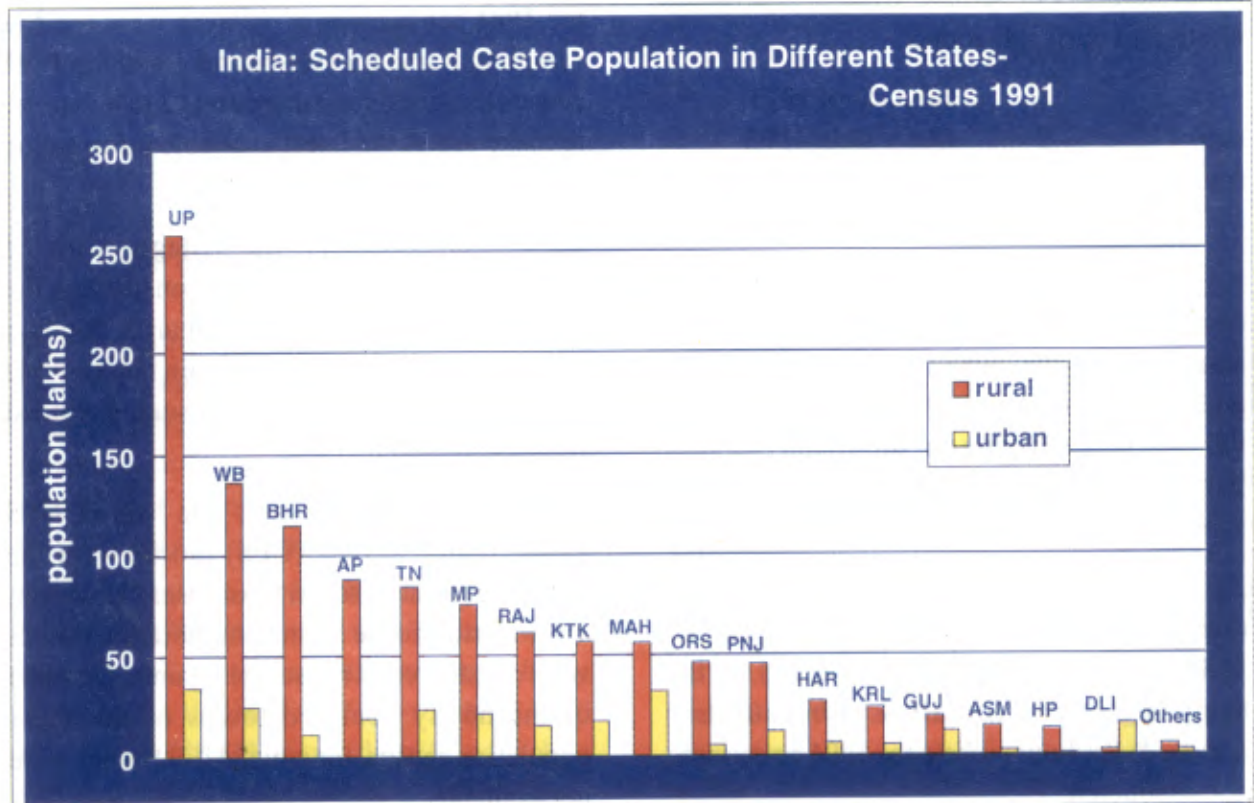

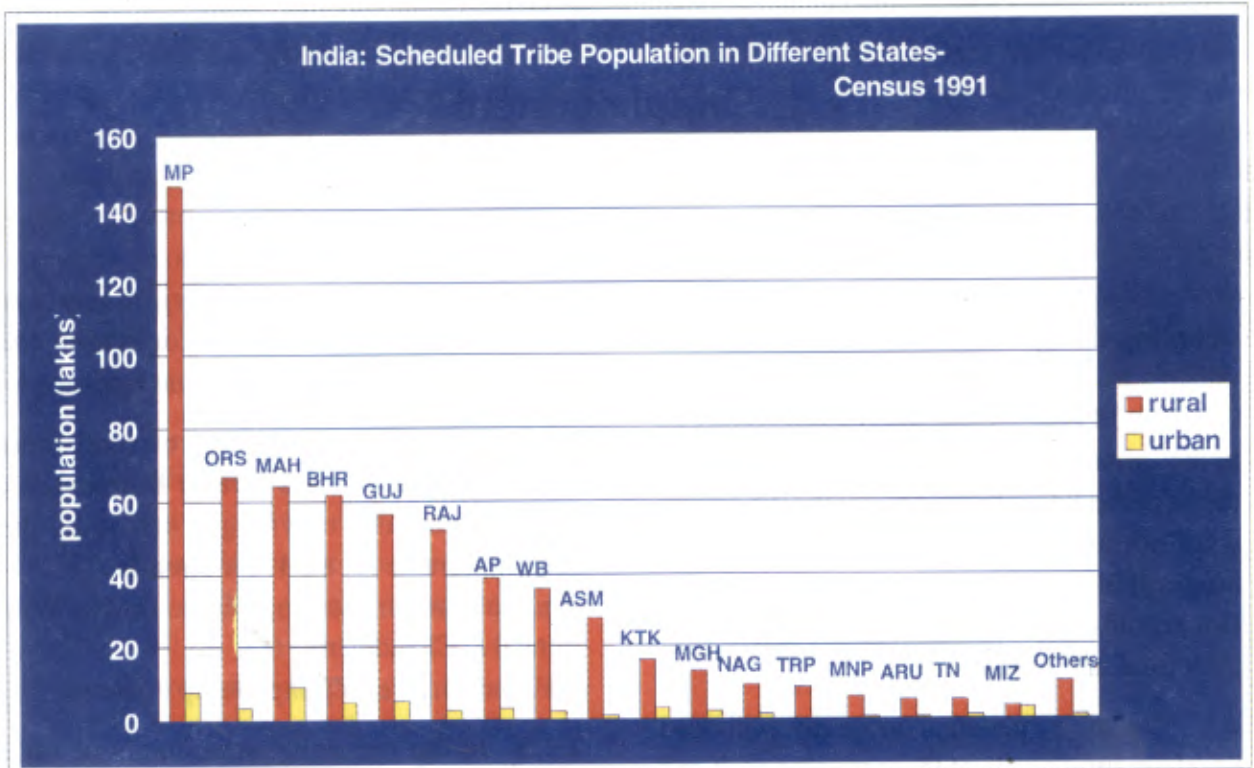

Notes

1. **The National Sample Survey:** The NSS was set up in 1950, with the idea of having a permanent survey organisation to collect data on various facets of the economy through nationwide sample surveys in order to assist in socio-economic planning and policy-making. The NSS is a continuing survey in the sense that it is carried out in the form of successive "rounds", each round usually of a year's duration covering several topics of current interest in a specific survey period. At present each NSS round reaches, at the all-India level, about 12,000 to 14,000 villages and blocks in the Central sample (covered by the Central agency NSSO) and an independent sample of about 14,000 to 16,000 villages and blocks in

the State sample (covered by the Governments of various states and union territories). The entire area of the country - rural and urban - is covered, with the exception of some interior areas of Nagaland and Andaman & Nicobar Islands, and Ladakh and Kargil districts of Jammu & Kashmir. In the 50th round, certain other districts of Jammu & Kashmir, viz. Doda, Anantnag, Pulwama, Srinagar, Badgam, Baramula and Kupwara, and Punjab's Amritsar district, had to be excluded from the survey due to unfavourable field conditions.

2. Household consumer expenditure survey: It was originally the practice to collect data on household consumer expenditure in every round of NSS, starting from the very first round (1950-51). From 1972-73, according to a decision of the Governing Council of NSSO,

the consumer expenditure survey became a quinquennial feature. It was also integrated with the employment and unemployment survey in the sense that a common sample of households was subjected to both the enquiries. An annual series of smaller-scale consumer expenditure surveys was again launched from the 42nd round (1986-87) to fill the data gaps which planners and researchers had begun to feel. It is the larger-scale quinquennial surveys, however, which are expected to be most useful for the study of trends in the level of consumer expenditure and of the emergence of new spending patterns. The five quinquennial surveys of consumer expenditure have been those of the 27th, 32nd, 38th, 43rd and 50th rounds of NSS. They relate, respectively, to the years 1972-73, 1977-78, 1983, 1987-88 and 1993-94.

Section 2

Sample design

2.0 Sample Design: A stratified two-stage sampling design was adopted, with census villages as first stage units (fsu's) in the rural sector and Urban Frame Survey (UFS) blocks in the urban, except for a few newly declared towns of the 1991 census, for which UFS frames were not available, and census enumeration blocks (EB's) were used as first stage units. Households formed the second stage units in both rural and urban sectors.

2.1 The survey period of one year was divided into four sub-rounds of three months each and equal numbers of sample villages and blocks allotted to each sub-round.

	1	July - Sept 1993
sub-	2	Oct - Dec 1993
rounds	3	Jan - Mar 1994
	4	Apr - June 1994

2.2 Sampling frame for fsu's : In the rural sector, the sampling frame was provided sometimes by the 1981 census list of villages and sometimes by the 1991 census list of villages, depending on the sub-round (see para 2.1) and the state/union territory being surveyed, as follows.

2.2.1 In the following areas of rural India (hereafter referred to as **Group A areas**), the **1981** census lists of villages served as the sampling frame for **all 4 sub-rounds** : Jammu & Kashmir - where the 1991 census was not conducted.

Agra district of U.P. and Durg, Sagar and Morena districts of M.P. - for which the available information for **1991** was incomplete.

2.2.2 In the following areas of rural India (hereafter referred to as **Group B areas**), the **1991** census lists of villages served as the sampling frame for **all 4 sub-rounds** :

Andhra Pradesh, Assam, Kerala, Orissa, West Bengal & Chandigarh.

U.P. and M.P. (excepting Group A areas).

2.2.3 In the remaining states/u.t.'s of rural India (hereafter referred to as **Group C areas**), the **1981** census lists of villages were used as sampling frame for **sub-round 1** and the **1991** census lists used for **sub-rounds 2 to 4** in order to make use of the latest available information in the sample selection process.

2.2.4 For Nagaland, the villages situated within 5 km of a bus route constituted the sampling frame. For the Andaman & Nicobar Islands, the villages which remain inaccessible throughout the year were, as usual, excluded from the sampling frame.

2.2.5 In the urban sector, the lists of NSS Urban Frame Survey (UFS) blocks were the sampling frames used in most cases. However, 1991 census house listing enumeration blocks were considered as the sampling units for some of the newly declared towns of the 1991 population census, for which UFS frames were not available.

2.3 Stratification: As usual, each state/union territory (u.t.) was divided into one or more agro-economic regions by grouping contiguous districts which are similar with respect to population density and crop pattern. In Gujarat, however, some districts were sub-divided for the purpose of region formation on the basis of location of dry areas and the distribution of tribal population in the state. The total number of regions formed in the whole of India was 78.

2.3.1 In the rural sector, within each region, each district normally formed a separate stratum. However, if the census population of the district according to the sampling frame used exceeded 1.8 million / 2 million (depending on whether 1981 or 1991 census frame was used), the district was split into two or more strata by grouping contiguous tehsils. In Gujarat, however, in case of districts extending over more than one region, the portion of a district falling in each region constituted a separate stratum even if the rural population of the district as a whole was less than 1.8 million / 2 million.

2.3.2 In the urban sector, strata were formed, again within NSS regions, on the basis of town population. In order to be able to allocate a larger proportion of the sample to the affluent section of society and thus improve the precision of the overall estimate of consumer expenditure, the usual first-stage stratification procedure was modified as Confidential Page 4 07/27/98 census population 400,000 or more were placed in different strata depending on whether they belonged to the "affluent" area of the town or not - the information on affluent areas being supplied by the regional/sub-regional field offices of NSSO. Full details of urban stratification are given below.

2.4 Following usual NSS practice, the sample of villages and blocks in which the enquiry was carried out was drawn in the form of two independent **sub-samples**. Either of these sub-samples could be used to generate a valid set of estimates which might be regarded as the provisional results of the survey until such time as the final results, based on the entire sample, were available.

stratum	composition
1	towns with population less than 50000
2	towns with population 50000 - 199999
3	towns with population 200000 - 399999
4	towns with population 400000 - 999999 - affluent areas
5	towns with population 400000 - 999999 - other areas
6	a single city (if any) with population 1 million or more : affluent areas
7	a single city (if any) with population 1 million or more : other areas
8	another city (if any) with population 1 million or more : affluent areas
9	another city (if any) with population 1 million or more : other areas

2.5 Allocation of sample: The first-stage sample size for any state/union territory of India was determined on the basis of its investigator strength and the expected workload per investigator. This sample was first allotted to the rural and urban sectors in consideration of the relative sizes of the rural and urban population with double weightage to the urban sector.

2.5.1 Within the **urban** sector of a state/u.t., allocation of the sample to the different urban strata was done in proportion to stratum population with double weightage to affluent strata - that is, strata 4,6 & 8 (see para 2.3.2). Stratum level allocations were adjusted to multiples of 8 as far as possible so as to have equal allocations for each sub-sample-sub-round combination.

2.5.2 Within the **rural** sector of a state/u.t., allocation of the sample to the different rural strata was done as follows.

2.5.3 For Group B areas (see para 2.2), the state/u.t. level rural sample was allocated to the different rural strata in proportion to 1991 census population. For other areas (Group A and Group C), allocation was initially made on the basis of 1981 census population. Stratum level allocations were adjusted to multiples of 8 as far as possible so as to have equal allocations for each sub-sample-sub-round combination.

2.5.4 However, for Group C areas, the original allocations for sub-rounds 2 to 4 were revised as follows. The total state/u.t. level allocation for sub-rounds 2 to 4 combined - 75% of the total as 25% had gone to sub-round 1 - was re-allocated to the rural strata in proportion to stratum population as per **1991** census. Stratum level allocations were adjusted to multiples of 6 as far as possible so as to have equal allocations for the remaining sub-sample-sub-round combinations.

2.6 **Selection of fsu's** : Sample villages - except in Arunachal Pradesh - were selected by PPS circular systematic sampling (with population as the size variable) from the appropriate sampling frame as explained in para 2.2, in the form of two independent **sub-**

samples. Sample blocks were selected by ordinary (equal probability) circular systematic sampling, also in the form of two independent sub-samples.

2.6.1 In Arunachal Pradesh the sample of villages was drawn by a cluster sampling procedure. The field staff were supplied with a list of sample "nucleus" villages and were advised to select clusters of villages - building up each cluster around a nucleus village - according to prescribed guidelines. The nucleus villages were selected circular systematically with equal probability, in the form of two independent sub-samples.

2.7 **Selection of hamlet-groups/ sub-blocks**: To reduce workload the following procedure was adopted in drawing up the second-stage sampling frame. Larger sample villages and blocks were divided - according to usual NSS practice - into a suitable number of "hamlet-groups"/"sub-blocks" of roughly equal population content : the second-stage sampling frame was constituted of the households belonging to only two of these hamlet-groups, selected circular systematically, in case of sample villages, and one randomly selected sub-block in case of sample blocks (instead of the whole village/block). No hamlet-group formation was, however, done in Arunachal Pradesh. In Kerala, practical difficulties arose in hamlet-group formation during sub-round 1. These were resolved by selecting, instead of two hamlet-groups, two EB's from the constituent EB's of large villages.

2.8 **Selection of households** : The affluent classes of society have expenditure levels spread over a very wide section of the consumer expenditure range. As a result, the contribution of these the more homogeneous "middle

classes" (say). To improve the efficiency classes to the sampling error of a consumer expenditure survey is large compared to that of an equal-sized chunk of population belonging to of consumer expenditure estimates, it was decided that the second-stage sampling frames ought to be stratified in such a way as to be able to allocate a larger proportion of the sample to the affluent sections of the population wherever they could be located.

2.8.1 Rural : In sample villages, households in the second-stage sampling frame were divided into two strata as follows. Households - if any - exhibiting signs of affluence such as the possession of any of a specified list of assets including land in excess of a certain specified area, or a member holding a good salaried job or belonging to a paying profession such as that of a doctor or advocate, were designated "affluent households" and the top 10 such households (subject to availability) placed in stratum 1. The remaining households formed second-stage stratum 2. **Two** households were selected circular systematically from second-stage stratum 1. From second-stage stratum 2, **eight** households were selected circular systematically after arranging the households in the stratum by "means of livelihood"; this meant that households "self-employed in agriculture" were placed first, followed by "rural labour" households, and then the "others". Further, the households under "others" were arranged in five different land-possessed classes to ensure spread of the sample over households of different economic statuses.

2.8.2 Urban : In sample blocks, households with monthly per capita consumer expenditure (as reported at the time of household listing) Rs. 1200 or more (Rs. 1500 or more in towns with population one million and above) were

placed in second-stage stratum 1 and the rest in second-stage stratum 2. In sample blocks belonging to first-stage strata 4, 6 & 8 (affluent areas of towns with population 4 lakhs or more), as many as **four** sample households were selected for survey from second-stage stratum 1 and **six** from second-stage stratum 2. In all strata other than those numbered 4, 6 & 8, **two** sample households were selected from second-stage stratum 1 and **eight** from second-stage stratum 2. In each case the sample of households, for each second-stage stratum, was drawn circular systematically with a random start. The households in second-stage stratum 2 were, prior to sample selection, placed in eight different groups and the different groups of households placed one after another in a specified order to ensure spread of the sample over the different groups. The grouping was done on considerations of means of livelihood (self-employed / regular wage or salary earning / casual labour / others) and household monthly per capita consumer expenditure.

2.9 Sample size : The survey covered, in all, 115354 households spread over 11601 sample villages/blocks. The number of sample villages and blocks allotted and surveyed, and the number of sample households and persons surveyed, are given for different state/u.t.'s and all-India in Table T0, separately for rural and urban sectors.

2.10 Estimation Procedure

2.10.1 Estimation of aggregates at sub-sample level : Aggregates are first estimated at sub-sample level according to the following estimation formulae, where \hat{y} denotes the estimate - based on one sub-sample - of the aggregate of a given characteristic Y for a sector of a state/u.t.

For the rural sector of a state/u.t. other than Arunachal Pradesh,

$$\hat{Y} = \sum_s \frac{1}{n_s} \sum_i \frac{P_{si} D_{si}^*}{P_{si}} \sum_{t=1}^2 \frac{H_{sit}}{h_{sit}} \sum_{j=1}^{h_{sit}} y_{sitj}$$

For the rural sector of Arunachal Pradesh,

$$\hat{Y} = \sum_s \frac{1}{n_s} \sum_{i=1}^{n_s} N_{si} \sum_{t=1}^2 \frac{H_{sit}}{h_{sit}} \sum_{j=1}^{h_{sit}} y_{sitj}$$

For the urban sector of a state/u.t.,

$$\hat{Y} = \sum_s \frac{N_s}{n_s} \sum_{i=1}^{n_s} D_{si} \sum_{t=1}^2 \frac{H_{sit}}{h_{sit}} \sum_{j=1}^{h_{sit}} y_{sitj}$$

where

- y : observed value of the same characteristic in a sample household
- s : stratum suffix
- t : second-stage stratum suffix
- i : sample village/block suffix
- j : sample household suffix
- D : number of hamlet-groups/sub-blocks formed in the surveyed village/block
- H : number of households listed in the second-stage sampling frame
- h : number of sample households surveyed
- p : population of sample village as in the sampling frame

N : for the urban sector, number of blocks in the sampling frame

n : number of sample villages/blocks surveyed in this sub-sample

Psi : population of the s-th stratum as per frame used in the selection of i-th sample village of the stratum

Nsi : for Arunachal Pradesh, number of sample villages in the sampling frame for s-th stratum which was used in selection of i-th sample village of the stratum

D* : equals 1, if D = 1
equals D/2 if D > 1

2.10.2 Estimation of aggregates for the combined sample (pooling sub-samples): The combined sample estimate of an aggregate is obtained as the simple average of the corresponding sub-sample estimates.

2.10.3 Estimates of ratios: The estimate of a ratio of the form $R = Y/X$, where Y and X are the population aggregates of two characters, is obtained as

$$\hat{R} = \frac{\hat{Y}}{\hat{X}}$$

where \hat{Y} and \hat{X} are estimates of Y and X obtained according to the procedure laid down in paras 2.10.1 and 2.10.2. Examples of ratio estimates are rates and percentages.

Table T0: Number of villages/blocks allotted and surveyed and number of sample households and persons surveyed

state/u.t.	number of				number of surveyed

Section 3

Concepts and Definitions

3.1 Household : A group of persons normally living together and taking food from a common kitchen constitutes a household. The word "normally" means that temporary visitors are excluded but temporary stay-aways are included. Thus a son or daughter residing in a hostel for studies is excluded from the household of his/her parents, but a resident employee or resident domestic servant or paying guest (but not just a tenant in the house) is included in the employer/host's household. "Living together" is usually given more importance than "sharing food from a common kitchen" in drawing the boundaries of a household in case the two criteria are in conflict; however, in the special case of a person taking food with his family but sleeping elsewhere (say in a shop or a different house) due to space shortage, the household formed by such a person's family members is taken to include the person also. Each inmate of a mess, hotel, boarding and lodging house, hostel, etc. is considered as a single-member household except that a family living in a hotel (say) is considered as one household only; the same applies to residential staff of such establishments.

3.2 Household consumer expenditure: The expenditure incurred by a household on domestic consumption during the reference period is the household's consumer expenditure. The household consumer expenditure is the total of the monetary values of consumption of

various groups of items namely (i) food, pan (betel leaves), tobacco, intoxicants and fuel & light, (ii) clothing and footwear and (iii) miscellaneous goods and services and durable articles.

3.2.1 For groups (i) and (ii), the total value of consumption is derived by aggregating the monetary value of goods actually consumed during the reference period. An item of clothing and footwear would be considered to have been consumed if it is brought into maiden or first use during the reference period. The consumption may be out of (a) purchases made during the reference period or earlier; (b) home grown stock; (c) receipt in exchange of goods and services; (d) any other receipt like gift, charity, borrowing and (e) free collection. Home produce is evaluated at the ex farm or ex factory rate. For evaluating the consumption of the items of group (iii) i.e. items categorised as miscellaneous goods and services and durable articles, a different approach is followed. In this case, the expenditure made during the reference period for the purchase of goods and services is considered as consumption.

3.2.2 It is pertinent to mention here that the consumer expenditure of a household on food items relates to the actual consumption by the normal resident members of the household and also by the guests whether during ceremonies or otherwise. To avoid double counting, transfer payments like charity, loan advance, etc. made by the household are not considered as

consumption for items of groups (i) and (ii), since transfer receipts of these items have been taken into account. However, the item "cooked meals" is an exception to the rule. Meals prepared in the household kitchen and provided to the employees and/or others would automatically get included in domestic consumption of employer (payer) household. There is a practical difficulty of estimating the quantities and values of individual items used for preparing the meals served to employees or to others. Thus, to avoid double counting, cooked meals received as perquisites from employer household or as gift or charity are not recorded in the recipient household. As a general principle, cooked meals purchased from the market for consumption of the normal resident members and for guests and employees will also be recorded in the purchaser household.

3.2.3 This procedure of recording cooked meals served to others in the expenditure of the serving households only leads to bias-free estimates of average per capita consumption as well as total consumer expenditure. However, as the proportions of donors and recipients of free cooked meals are likely to vary in opposite directions over the expenditure classes, the nutritional intake derived from the consumer expenditure survey data may present a somewhat distorted picture. These derived nutrition intakes may get inflated for the rich (net donors) and somewhat understated for the poor (net recipients). This point has to be kept firmly in mind while using the NSS consumer expenditure data for any nutritional studies relating to the nutritional status of households.

3.4 **Reference period:** Consumption data appearing in this report were all collected with

a reference period of "last 30 days", i.e. the 30 days immediately preceding the date of survey. The reference period used for the survey, in other words, was a "moving" one, varying from household to household.

3.5 **Sector:** A word used for the rural-urban demarcation: rural and urban are the only two sectors as far as this report is concerned.

3.6 **Reference period:** Consumption data appearing in this report were all collected with a reference period of "last 30 days", i.e. the 30 days immediately preceding the date of survey. The reference period used for the survey, in other words, was a "moving" one, varying from household to household.

3.7 **Major states:** This refers to the following states of India: Andhra Pradesh, Assam, Bihar, Gujarat, Haryana, Karnataka, Kerala, Madhya Pradesh, Maharashtra, Orissa, Punjab, Rajasthan, Tamil Nadu, Uttar Pradesh and West Bengal.

3.8 **Value of consumption:** Consumption out of purchase is evaluated at the purchase price. Consumption out of home produce is evaluated at ex farm or ex factory rate. Value of consumption out of gifts, loans, free collection, and goods received in exchange of goods and services is imputed at the rate of average local retail prices prevailing during the reference period.

3.9 **Consumption out of home-grown or home-produced stock:** Home-produced or home-grown stock refers to goods produced by households in their own farm or manufacturing establishment and crop received as rent on land leased out. Produce brought from village home and consumed at urban residence is also included. Valuation excludes transport charges

for carrying the commodity to the place of residence for consumption.

3.10 Household size: The size of a household is the total number of persons in the household.

3.11 Monthly per capita expenditure (MPCE): For a household, this is household consumer expenditure over a period of 30 days divided by household size. A person's MPCE is understood as that of the household to which he/she belongs.

3.12 MPCE classes : It is the usual practice, in NSS consumer expenditure reports, to present various estimates, including state and all-India level values of different socio-economic indicators, and distributions of households and persons over different socio-economic categories or statuses, separately for a number of classes of the population formed on the basis of MPCE. For the 50th round, 12 MPCE classes were drawn up for each sector - rural and urban - as follows. For the rural (urban) sector, the class limits were so chosen that each class, excepting the top two classes and the bottom two, approximately contained an estimated 10% of the rural (urban) population, while the remaining four classes each contained an estimated 5% of the population. Some adjustments were, however, made to keep some common class limits for the rural and urban sectors. The same procedure using 43rd round population estimates, was used to draw up the MPCE classes used for tabulation of consumer expenditure data from the 43rd round to the 49th round, uniformly. The present classes represent the first updation of the MPCE classification since the 43rd round. The classes are:

	RURAL (Rs)	URBAN (Rs)
1.	below 120	below 160
2.	120 - 140	160 - 190
3.	140 - 165	190 - 230
4.	165 - 190	230 - 265
5.	190 - 210	265 - 310
6.	210 - 235	310 - 355
7.	235 - 265	355 - 410
8.	265 - 300	410 - 490
9.	300 - 355	490 - 605
10.	355 - 455	605 - 825
11.	455 - 560	825 - 1055
12.	560 & above	1055 & above

3.13 Socio-economic category: Attempts were made in this report to classify households into different socio-economic categories using three distinct characteristics viz. (i) social group (ii) household type and (iii) size class of land possessed by the household. The following are the detailed specifications of the socio-economic categories of households thus formed.

3.14 Household type: Rural households were classified into five types and urban households into four types on the basis of the occupations pursued by the household type members. The five types of rural households are self-employed in on-agriculture, agricultural labour, other labour, self-employed in agriculture, and other households. The four types of urban household are: self-employed, regular wage / salary earner, casual labour, and other households.

The "type" of a household was determined as follows.

Rural

3.14.1 A household was classified as "agricultural labour", if its income from that source was 50% or more of its total income.

The same criterion was followed to classify a household as "self-employed in agriculture". A household was classified as "self-employed in non-agriculture" if its income from that source was greater than that from rural labour as well as that from all other gainful sources put together. If a household was not one of these three types but its income from total rural labour was greater than that from all self-employment and from other gainful sources, it was classified as "other labour". The remaining households were classified as "other households".

Urban

3.14.2 A household was classified as

"self-employed", "regular wage or salary earning", or "casual labour", according to the major sources of its income from "gainful employment" during the 365 days preceding the date of survey. A household not having any income from gainful employment was classified under "others".

3.15 **Household group:** Three social groups were distinguished - scheduled tribe, scheduled caste, and other households.

3.16 **Land possessed:** The area of land possessed (in hectares) includes land owned, leased in, and (encroached) land neither owned nor leased in, but excludes land leased out.

Distribution of rural population by social group for different size classes of land possessed, 1993-94

Section 4

Summary of findings

4.0 The main findings on variation in the level and pattern of consumer expenditure by household occupation "type", household social group and size of land possessed have been discussed in this chapter. For this purpose distributions of persons by MPCE levels have been generated, for each sector of each state and u.t., separately for households in important occupational types (Part II Tables 1R & 1U), separately for SC and ST households (Part II Tables 2R & 2U) and for rural areas, separately for households in 6 different size classes of "land possessed" (Part II Table 3R). At the all-India level, moreover, MPCE distributions have been generated separately for each group-type-land combination in the rural sector (Part II Table 4R) and for each group-type combination in the urban sector (Part II Table 4U).

MPCE and social group : a state-by-state look

4.1 Table T6 (p.25) shows per 1000 numbers of rural and urban persons in different states below specified MPCE levels separately for SC and ST groups, with "all" (groups) rows provided for comparison. The MPCE levels chosen are, roughly, the 20th, 40th, and 80th percentiles of the all-India rural and urban MPCE distributions, which is why the figures in the very last row (all-India: all) of the table are close to 200, 400, and 800 for each sector. The following conclusions can be reached.

4.1.1 Barring a few states, the MPCE position of the SC and ST groups in every state was consistently poorer than that of the general population of the state, as evidenced by proportion of persons falling in the lower MPCE ranges. This was true of both rural and urban areas of states where persons belonging to these social groups were present in significant numbers.

4.1.2 Among the states with large ST populations, the ST group was specially depressed (relative to the general population) in Orissa and M.P. In Maharashtra, Bihar, Gujarat, Rajasthan and Andhra Pradesh, percentages of ST population in the lower MPCE ranges were of the same order as corresponding percentages of SC population, and high compared to the general population. In West Bengal, the association between poverty and social group was much less noticeable. Poverty appeared to affect the SC group in Orissa to more or less the same extent as it did the general population, while the ST group in Assam actually had smaller percentages of persons in the low MPCE ranges than the general population of the state.

MPCE and household occupation type : the national pattern

Rural household types

4.2 Compared to the household group factor,

all-India	25	49	31	22	30

the influence of household type on the rural distribution of MPCE is more uniform across states: all the states show a similar "national" pattern. This is illustrated by Table T1, showing percentage of rural population with MPCE below Rs. 190 - which is roughly the level below which 30% of the rural population of India lives - for important household types in each of the 15 major states. The table illustrates certain basic features of the relationship between household type and MPCE in rural areas.

4.2.1 In practically every major state, the proportion of population below a specified MPCE level is greater than the average ("all"

types) for the "labour" households and lower than the average for the "self-employed" and the "other households" (which include regular salary earners).

4.2.2 Among the household types the proportion of the poor is the highest among "agricultural labour" households in all states except Assam (where it is highest among "other labour" households). In Haryana, where all other household types are, in terms of MPCE, much better off than the average rural Indian, the position of the agricultural labour class is nearly as bad as that of agricultural labour elsewhere in the country.

Urban household types

4.3 In urban areas, the self-employed households accounted for about 37% of urban population of India, and the regular wage/salary earning, for about 43%, and the remaining 20% was made up of casual labour households and "others".

4.4 Table T2 highlights the differences in MPCE distributions of three important household types, and also shows that, as in the rural sector, an all-India pattern is evident in every major state

4.4.1 The MPCE levels of casual labour households were substantially lower than either self-employed or regular wage/salary earning households. While only 28% of the entire urban population of India was below the MPCE level of Rs. 265, more than 53% of persons belonging to casual labour households were below this

level in all major states except Kerala, Punjab, Haryana and Gujarat, where the percentage was between 31 and 45, and more than 60% were below this level in 7 states including Bihar, U.P., Orissa and M.P.

4.4.2 The condition of self-employed households was in nearly every major state a little below the average for all households, a notable exception being Gujarat, where their

	65	33	2	casual labour	57	40	3	
	34	52	14	all	28	52	20	

MPCE situation was distinctly above average.

4.4.3 Regular wage/salaried households had lower percentages of persons in the low-MPCE ranges, and higher percentages in the upper ranges, than other household types, uniformly in all major states.

4.4.4 At the all-India level only 3% of casual labour households had MPCE exceeding Rs. 605, the percentage being higher than this in only four major states: Gujarat (4%), Kerala (6%), Haryana (8%), and Punjab (15%).

MPCE and household land possessed in rural areas

4.5 Land scarcity and poverty are expected to remain closely linked in rural India as long as agriculture remains undeveloped and traditional. The nature of association between MPCE and possession of land is brought out in Table 3R of the Part II Survey Results, where MPCE distributions for rural areas of each state/ u.t. are given separately for 6 different classes of size of household land possessed.

4.6 Figures 4 and 5 show percentages of population below MPCE levels of Rs. 140 and Rs. 190 (respectively, the 10th and 30th percentiles of the all-India rural distribution of MPCE) for households in different size classes of land possessed in the 15 major states.

4.7 The line diagram for each state in Figures 4 and 5 is a combination of line segments, each depicting rise or fall (generally fall) in percentage of persons with MPCE below Rs. 140 (Rs. 190) as one moves from low land possessed classes to the next class. A horizontal stretch over size classes A to B indicates that increase in size of land possessed from A to B does not affect poverty: the proportion of the poor, i.e. those with MPCE lower than Rs. 140

(Rs. 190), remains the same. A steep decline over size classes A to B indicates that increase in size of land possessed is crucial in bringing about an improvement in level of living.

4.8 The relation between poverty and land scarcity appears to be strongest in Assam, Karnataka, Maharashtra, and West Bengal, where the lowest size class is especially poverty-stricken. As one moves upwards, from the lowest size class of land possessed, percentages of population below specified MPCE levels below Rs. 140 decline significantly only from the third size class (0.41-1 hectare) onwards in

Bihar and U.P., and only from the fourth size class (1-2 hectares) in Orissa and M.P.1 Poverty appears to be less strongly associated with small land holdings in Andhra Pradesh and Tamil Nadu (and in Gujarat and Rajasthan where its incidence is, of course, lower).

4.9 The upper tail of the MPCE distribution also changes with size class of land possessed, and the change is sharper in some states than in others. Thus, Table T3 shows that the persons ranking among the richest 5% of the rural population of India (MPCE Rs. 560 or more) were, in the states of Bihar, Kerala, Orissa and West Bengal, more than four times

as numerous in the highest size class of land possessed (over 4 hectares) class, relative to the state as a whole.

Inter-social-group differences in MPCE: variation among occupational types in rural areas

4.10 All-India MPCE distributions have been worked out (Tables 4R and 4U) for each combination of household type, social group, and land possessed size class. This enables one to see whether the three factors influence MPCE independently of one another, or whether there are, so to speak, interaction effects. One pair of factors of special interest is formed by social group and household

occupational type in the rural sector.

4.11 The point of interest here is whether inter-social-group disparities in MPCE are of the same nature for different household types, or different.

4.12 Each row of Table 4R gives the all-India (rural) MPCE distribution for a particular socio-economic category of persons. Since the land factor is not of interest here, only the "all size classes" rows need to be considered. Table T4 shows some cells of these rows (to be precise, the cells for per 1000 number of persons in the two lowest and the two top MPCE classes) and brings some important differences into sharper focus.

4.12.1 Extreme poverty is most common among ST households for all types of households except possibly for "other households" (which include regular salary earners). For each household type, the "others" social group is less affected by poverty than the SC or ST groups.

4.12.2 Differences among social groups in the incidence of extreme poverty are more pronounced among the self-employed types than among the "labour" or "other" households.

4.12.3 Differences among social groups in the upper tail of the MPCE distribution are most prominent for households self-employed in

agriculture. Disparities in this respect are relatively low for "self-employed in non-agriculture" and "labour" households.

Relation between MPCE and land possessed: differences among household occupational types

4.13 To some extent, household type and land possessed are themselves associated, and do not vary independently of each other. For instance, Figure 3 shows that four of the six land size classes considered here are dominated (numerically) by households self-employed in agriculture, which account for over 50% of population in the size class 0.41-1 hectare, nearly 75% of population in the next size class (1-2 ha.) over 80% in the size class 2-4 ha., and nearly 90% in the top size class. As a result, the distributions of MPCE for all household types taken together in these land size classes are largely determined by (and, for the top two classes, almost identical with) the distributions for the households self-employed in agriculture in the corresponding size classes. However, the following observations can be made with the help of Table T5, which shows, for each household type and land possessed size class, number of persons per 1000 below MPCE levels of (a) Rs. 140 and (b) Rs. 190 (the 10th and 30th percentiles of the all-India rural MPCE distribution) and number of persons above the 90th percentile, Rs. 455, of the all-India distribution.

4.13.1 As one moves from lower size classes of land possessed to higher classes, the percentage of persons in the upper MPCE range (90th percentile & above) shows no rise among "other labour" households or "other" households.

4.13.2 The percentage of high-MPCE persons does begin to rise with increase in land possessed among self-employed households, but only when the size classes with over 1 hectare of land are reached, and for agricultural labour households only at the topmost size class (over 4 hectares).

4.13.3 When all household types are considered together (bottom rows of Table T5), the percentage of persons with MPCE below Rs. 190 declines steadily with an increase in size class of land. When one focusses on individual household types, this percentage declines among the self-employed (agriculture or non-agriculture) but not among the "labour" households.

4.13.4 The percentage of persons below the 10th percentile of the rural MPCE distribution - Rs. 140 - declines steadily with increase in size class of land possessed when all household types are considered. But when the individual household types are taken up separately, this percentage of the very poor declines steadily with increase in land only among the self-employed in non-agriculture. Among the self-employed in agriculture, this percentage is a uniform 6-7% in all size classes except the highest (4 hectares plus) where it is under 3.5.

1.0 The NSSO conducted its fifth quinquennial survey of household consumer expenditure in India during 1993-94. The survey was spread over the entire geographical area of the country. Interviews were conducted of 115354 households in 6951 villages and 4650 urban blocks. The present report is one of a series of reports based on the survey. It deals with wages and salaries received in kind, gifts (non-cash), expenditure on ceremonies, and insurance expenditure.

A Note on Wages in Kind, Exchange of Gifts and Expenditure on Ceremonies & Insurance in India, NSS 50th Round (1993-94)

Section 1

Introduction

1.0 The NSSO conducted its fifth quinquennial survey of household consumer expenditure in India during 1993-94. The survey was spread over the entire geographical area of the country. Interviews were conducted of 115354 households in 6951 villages and 4650 urban blocks. The present report is one of a series of reports based on the survey. It deals with wages and salaries received in kind, gifts (non-cash), expenditure on ceremonies, and insurance expenditure.

1.1 The most important way in which goods and services consumed are acquired in the first place by the consuming household are: one, cash purchase, and two, home production. Next come goods and services received in kind from the employer, and gifts. Data on the last two aspects were also collected separately for NSS surveys of household consumption in this round.

1.2 In the 50th round survey, the consumer expenditure schedule had a separate block for

collecting information on **gifts given and received** by household members, and goods and services received by household members as **wages and salaries in kind** or perquisites. The extent to which house-hold consumption depends on these two sources - wages in kind and gifts - is studied in this note.

1.3 Ceremonies performed by households are an important problematic element in consumer expenditure surveys as they can inflate the reported consumer expenditure of a household far above the normal level. Data on the incidence of ceremonies of all kinds (marriages, funerals, birthdays, and so on) and the average expenditure incurred by households performing such ceremonies are also presented in this note.

1.4 Data on amount of insurance premium paid by type of insurance were also collected from each sample household. The results are discussed in this note.

Section 2

Sample design and definitions

2.0 Sample Design: A stratified two-stage sampling design was adopted, with census villages as first stage units (fsu's) in the rural sector and Urban Frame Survey (UFS) blocks in the urban, except for a few newly declared towns of the 1991 census, for which UFS frames were not available, and census enumeration blocks (EB's) were used as first stage units. Households formed the second stage units in both rural and urban sectors.

2.1 The survey period of one year was divided into four sub-rounds of three months each and equal numbers of sample villages and blocks allotted to each sub-round.

	1	July - Sept 1993
sub-	2	Oct - Dec 1993
rounds	3	Jan - Mar 1994
	4	Apr - June 1994

2.2 Sampling frame for fsu's : In the rural sector, the sampling frame was provided sometimes by the 1981 census list of villages and sometimes by the 1991 census list of villages, depending on the sub-round (see para 2.1) and the state/union territory being surveyed, as follows.

2.2.1 In the following areas of rural India (hereafter referred to as **Group A areas**), the **1981** census lists of villages served as the sampling frame for **all 4 sub-rounds**:
Jammu & Kashmir - where the 1991 census was not conducted.

Agra district of U.P. and Durg, Sagar and Morena districts of M.P. - for which the available information for 1991 was incomplete.

2.2.2 In the following areas of rural India (hereafter referred to as **Group B areas**), the 1991 census lists of villages served as the sampling frame for **all 4 sub-rounds** :

Andhra Pradesh, Assam, Kerala, Orissa, West Bengal & Chandigarh.

U.P. and M.P. (excepting Group A areas).

2.2.3 In the remaining states/u.t.'s of rural India (hereafter referred to as **Group C areas**), the **1981** census lists of villages were used as sampling frame for **sub-round 1** and the **1991** census lists used for **sub-rounds 2 to 4** in order to make use of the latest available information in the sample selection process.

2.2.4 For Nagaland, the villages situated within 5 km of a bus route constituted the sampling frame. For the Andaman & Nicobar Islands, the villages which remain inaccessible throughout the year were, as usual, excluded from the sampling frame.

2.2.5 In the urban sector, the lists of NSS Urban Frame Survey (UFS) blocks were the sampling frames used in most cases. However, 1991 census house listing enumeration blocks were considered as the sampling units for some of the newly declared towns of the 1991 population census, for which UFS frames were not available.

2.3 Stratification: As usual, each state/union territory (u.t.) was divided into one or more agro-economic regions by grouping contiguous districts which are similar with respect to population density and crop pattern. In Gujarat, however, some districts were sub-divided for the purpose of region formation on the basis of location of dry areas and the distribution of tribal population in the state. The total number of regions formed in the whole of India was 78.

2.3.1 In the rural sector, within each region, each district normally formed a separate stratum. However, if the census population of the district according to the sampling frame used exceeded 1.8 million / 2 million (depending on whether 1981 or 1991 census frame was used), the district was split into two or more strata by grouping contiguous tehsils. In Gujarat, however, in case of districts extending over more than one region, the portion of a district falling in each region constituted a separate stratum even if the rural population of the district as a whole was less than 1.8 million / 2 million.

2.3.2 In the urban sector, strata were formed, again within NSS regions, on the basis of town population. In order to be able to allocate a larger proportion of the sample to the affluent section of society and thus improve the precision of the overall estimate of consumer expenditure, the usual first-stage stratification procedure was modified as follows. Urban blocks in towns with census population 400,000 or more were placed in different strata depending on whether they belonged to the "affluent" area of the town or not - the information on affluent areas being supplied by the regional/sub-regional field offices of NSSO. Full details of urban stratification are given below.

2.4 Following usual NSS practice, the sample of villages and blocks in which the enquiry was carried out was drawn in the form of two independent sub-samples. Either of these sub-samples could be used to generate a valid set of estimates which might be regarded as the provisional results of the survey until such time as the final results, based on the entire sample, were available.

stratum	composition
1	towns with population less than 50000
2	towns with population 50000 - 199999
3	towns with population 200000 - 399999
4	towns with population 400000 - 999999 - affluent areas
5	towns with population 400000 - 999999 - other areas
6	a single city (if any) with population 1 million or more : affluent areas
7	a single city (if any) with population 1 million or more : other areas
8	another city (if any) with population 1 million or more : affluent areas
9	another city (if any) with population 1 million or more : other areas

2.5 Allocation of sample: The first-stage sample size for any state/union territory of India was determined on the basis of its investigator strength and the expected workload per investigator. This sample was first allotted to the rural and urban sectors in consideration of the relative sizes of the rural and urban population with double weightage to the urban sector.

2.5.1 Within the **urban** sector of a state/u.t., allocation of the sample to the different urban strata was done in proportion to stratum population with double weightage to affluent strata - that is, strata 4,6 & 8 (see para 2.3.2). Stratum level allocations were adjusted to multiples of 8 as far as possible so as to have equal allocations for each sub-sample-sub-round combination.

2.5.2 Within the rural sector of a state/u.t., allocation of the sample to the different rural strata was done as follows.

2.5.3 For Group B areas (see para 2.2), the state/u.t. level rural sample was allocated to the different rural strata in proportion to 1991 census population. For other areas (Group A and Group C), allocation was initially made on the basis of 1981 census population. Stratum level allocations were adjusted to multiples of 8 as far as possible so as to have equal allocations for each sub-sample-sub-round combination.

2.5.4 However, for Group C areas, the original allocations for sub-rounds 2 to 4 were revised as follows. The total state/u.t. level allocation for sub-rounds 2 to 4 combined - 75% of the total as 25% had gone to sub-round 1 - was re-allocated to the rural strata in proportion to stratum population as per **1991** census. Stratum level allocations were adjusted to multiples of 6 as far as possible so as to have equal allocations for the remaining sub-sample-sub-round combinations.

2.6 **Selection of fsu's** : Sample villages - except in Arunachal Pradesh - were selected by PPS circular systematic sampling (with population as the size variable) from the appropriate sampling frame as explained in para 2.2, in the form of two independent **sub-**

samples. Sample blocks were selected by ordinary (equal probability) circular systematic sampling, also in the form of two independent sub-samples.

2.6.1 In Arunachal Pradesh the sample of villages was drawn by a cluster sampling procedure. The field staff were supplied with a list of sample "nucleus" villages and were advised to select clusters of villages - building up each cluster around a nucleus village - according to prescribed guidelines. The nucleus villages were selected circular systematically with equal probability, in the form of two independent sub-samples.

2.7 **Selection of hamlet-groups/ sub-blocks** : To reduce workload the following procedure was adopted in drawing up the second-stage sampling frame. Larger sample villages and blocks were divided - according to usual NSS practice - into a suitable number of "hamlet-groups"/"sub-blocks" of roughly equal population content: the second-stage sampling frame was constituted of the households belonging to only two of these hamlet-groups, selected circular systematically, in case of sample villages, and one randomly selected sub-block in case of sample blocks (instead of the whole village/block). No hamlet-group formation was, however, done in Arunachal Pradesh. In Kerala, practical difficulties arose in hamlet-group formation during sub-round 1. These were resolved by selecting, instead of two hamlet-groups, two EB's from the constituent EB's of large villages.

2.8 **Selection of households** : The affluent classes of society have expenditure levels spread over a very wide section of the consumer expenditure range. As a result, the contribution of these classes to the sampling error of a

consumer expenditure survey is large compared to that of an equal-sized chunk of population belonging to the more homogeneous "middle classes" (say). To improve the efficiency of consumer expenditure estimates, it was decided that the second-stage sampling frames ought to be stratified in such a way as to be able to allocate a larger proportion of the sample to the affluent sections of the population wherever they could be located.

2.8.1 Rural : In sample villages, households in the second-stage sampling frame were divided into two strata as follows. Households - if any - exhibiting signs of affluence such as the possession of any of a specified list of assets including land in excess of a certain specified area, or a member holding a good salaried job or belonging to a paying profession such as that of a doctor or advocate, were designated "affluent households" and the top 10 such households (subject to availability) placed in stratum 1. The remaining households formed second-stage stratum 2. **Two** households were selected circular systematically from second-stage stratum 1. From second-stage stratum 2, eight households were selected circular systematically after arranging the households in the stratum by "means of livelihood"; this meant that households "self-employed in agriculture" were placed first, followed by "rural labour" households, and then the "others". Further, the households under "others" were arranged in five different land-possessed classes to ensure spread of the sample over households of different economic statuses.

2.8.2 Urban : In sample blocks, households with monthly per capita consumer expenditure (as reported at the time of household listing) Rs. 1200 or more (Rs. 1500 or more in towns with population one million and above) were

placed in second-stage stratum 1 and the rest in second-stage stratum 2. In sample blocks belonging to first-stage strata 4, 6 & 8 (affluent areas of towns with population 4 lakhs or more), as many as four sample households were selected for survey from second-stage stratum 1 and six from second-stage stratum 2. In all strata other than those numbered 4, 6 & 8, two sample households were selected from second-stage stratum 1 and eight from second-stage stratum 2. In each case the sample of households, for each second-stage stratum, was drawn circular systematically with a random start. The households in second-stage stratum 2 were, prior to sample selection, placed in eight different groups and the different groups of households placed one after another in a specified order to ensure spread of the sample over the different groups. The grouping was done on considerations of means of livelihood (self-employed / regular wage or salary earning / casual labour / others) and household monthly per capita consumer expenditure.

2.9 Sample size : The survey covered, in all, 115354 households spread over 11601 sample villages/ blocks. The number of sample villages and blocks allotted and surveyed, and the number of sample households and persons surveyed, are given for different state/u.t.'s and all-India in Table T0, separately for rural and urban sectors.

2.10 Estimation Procedure

2.10.1 Estimation of aggregates at sub-sample level : Aggregates are first estimated at sub-sample level according to the following estimation formulae, where \hat{y} denotes the estimate - based on one sub-sample - of the aggregate of a given characteristic Y for a sector of a state/u.t.

For the rural sector of a state/u.t. other than Arunachal Pradesh,

$$\hat{Y} = \sum_s \frac{1}{n_s} \sum_i \frac{P_{si} D_{si}^*}{p_{si}} \sum_{t=1}^2 \frac{H_{sit}}{h_{sit}} \sum_{j=1}^{h_{sit}} y_{sitj}$$

For the rural sector of Arunachal Pradesh,

$$\hat{Y} = \sum_s \frac{1}{n_s} \sum_{i=1}^{n_s} N_{si} \sum_{t=1}^2 \frac{H_{sit}}{h_{sit}} \sum_{j=1}^{h_{sit}} y_{sitj}$$

For the urban sector of a state/u.t.,

$$\hat{Y} = \sum_s \frac{N_s}{n_s} \sum_{i=1}^{n_s} D_{si} \sum_{t=1}^2 \frac{H_{sit}}{h_{sit}} \sum_{j=1}^{h_{sit}} y_{sitj}$$

- y : observed value of the same characteristic in a sample household
- s : stratum suffix
- t : second-stage stratum suffix
- i : sample village/block suffix
- j : sample household suffix
- D : number of hamlet-groups/sub-blocks formed in the surveyed village/block
- H : number of households listed in the second-stage sampling frame
- h : number of sample households surveyed
- p : population of sample village as in the sampling frame

N : for the urban sector, number of blocks in the sampling frame

n : number of sample villages/blocks surveyed in this sub-sample

P_{si} : population of the s -th stratum as per frame used in the selection of i -th sample village of the stratum

N_{si} : for Arunachal Pradesh, number of sample villages in the sampling frame for s -th stratum which was used in selection of i -th sample village of the stratum

D^* : equals 1, if $D = 1$
equals $D/2$ if $D > 1$

2.10.2 Estimation of aggregates for the combined sample (pooling sub-samples): The combined sample estimate of an aggregate is obtained as the simple average of the corresponding sub-sample estimates.

2.10.3 Estimates of ratios: The estimate of a ratio of the form $R = Y/X$, where Y and X are the population aggregates of two characters, is obtained as

$$\hat{R} = \frac{\hat{Y}}{\hat{X}}$$

where \hat{Y} and \hat{X} are estimates of Y and X obtained according to the procedure laid down in paras 2.10.1 and 2.10.2. Examples of ratio estimates are rates and percentages.

* 26 nucleus villages

2.11.1 Household : A group of persons normally living together and taking food from a common kitchen constitutes a household. The word "normally" means that temporary visitors are excluded but temporary stay-aways are included. Thus a son or daughter residing in a hostel for studies is excluded from the household of his/her parents, but a resident employee or resident domestic servant or paying guest (but not just a tenant in the house) is included in the employer/host's household. "Living together" is usually given more importance than "sharing food from a common kitchen" in drawing the boundaries of a household in case the two criteria are in conflict; however, in the special case of a person taking food with his family but sleeping elsewhere (say in a shop or a different house) due to space shortage, the household formed by such a person's family members is taken to include the person also. Each inmate of a mess, hotel, boarding and lodging house, hostel, etc. is considered as a single-member household except that a family living in a hotel (say) is considered as one household only; the same applies to residential staff of such establishments.

2.11.2 Major states: This refers to the following states of India: Andhra Pradesh, Assam, Bihar, Gujarat, Haryana, Karnataka, Kerala, Madhya Pradesh, Maharashtra, Orissa, Punjab, Rajasthan, Tamil Nadu, Uttar Pradesh and West Bengal.

2.11.3 Household size: The size of a household is the total number of persons in the household.

2.11.4 Monthly per capita expenditure (MPCE): For a household, this is household consumer expenditure over a period of 30 days divided by household size. A person's MPCE

is understood as that of the household to which he/she belongs.

2.11.5 MPCE classes : It is the usual practice, in NSS consumer expenditure reports, to present various estimates, including state and all-India level values of different socio-economic indicators, and distributions of households and persons over different socio-economic categories or statuses, separately for a number of classes of the population formed on the basis of MPCE. For the 50th round, 12 MPCE classes were drawn up for each sector - rural and urban - as follows. For the rural (urban) sector, the class limits were so chosen that each class, excepting the top two classes and the bottom two, approximately contained an estimated 10% of the rural (urban) population, while the remaining four classes each contained an estimated 5% of the population. Some adjustments were, however, made to keep some common class limits for the rural and urban sectors. The same procedure using 43rd round population estimates, was used to draw up the MPCE classes used for tabulation of consumer expenditure data from the 43rd round to the 49th round, uniformly. The present classes represent the first updation of the MPCE classification since the 43rd round. The classes are:

	RURAL (Rs)	URBAN (Rs)
1.	below 120	below 160
2.	120 - 140	160 - 190
3.	140 - 165	190 - 230
4.	165 - 190	230 - 265
5.	190 - 210	265 - 310
6.	210 - 235	310 - 355
7.	235 - 265	355 - 410
8.	265 - 300	410 - 490
9.	300 - 355	490 - 605
10.	355 - 455	605 - 825
11.	455 - 560	825 - 1055
12.	560 & above	1055 & above

2.11.6 Insurance premium: Premium paid during the last 365 days for live policies & for revalidation of dead policies have been considered. Schemes like ULIP of UTI, Peerless, etc., which are primarily saving schemes, were not covered in this survey. The "insurance cover" during journey by air or rail provided by the Government or by private agencies, in which no premium is required to be paid separately, were also not considered.

2.11.7 Ceremonies: Ceremonies are performed to solemnize notable events of life e.g. birth, marriage, etc. Members of a household may also have to perform some religious rites consequent upon the death of a person. For various religious faiths, there are some days in a year which are observed with ceremonial performances, like offering of puja, prayer, and performance of other rituals. Such ceremonies may be performed by household members as required under the social/religious customs without incurring any expenditure for entertaining guests. On the other hand, households may have to spend something under different heads for the purpose of entertainment. Conventionally, certain expenditures of this kind are considered as

essential part of the ceremonies by the performing households.

2.11.8 For purposes of data collection, ceremonies were classified into the following types:

- (i) birth
- (ii) birthday
- (iii) mundan / head shaving
- (iv) annaprasan / first rice taking,
- (v) thread
- (vi) marriage
- (vii) marriage anniversary
- (viii) death
- (ix) others.

2.11.9 Miscellaneous goods and services: This group contains items other than food, pan, tobacco, intoxicants, fuel and light, clothing, footwear, rent, taxes and durable goods.

2.11.10 Durable goods: This term refers to durable goods apart from clothing and footwear; items included here are distinguished from miscellaneous goods by having a longer expected lifetime of use (roughly, one year or more).

Section 3

Wages in Kind & Gifts

3.0.0 Goods and services consumed by Indian households are mainly acquired by them through purchase. In rural India, a large section of households grow some of the food they consume.

3.0.1 Two relatively minor ways in which goods and services are acquired by households are: 1. as wages and salaries received in kind (or as "perquisites") 2. as gifts. This chapter is concerned with the extent of acquisition of goods and services by households in these ways in 1993-94.

3.0.2 Such information was collected in the 50th round of NSS through a special block of the household consumer expenditure schedule, canvassed in one-half of the entire sample of households.

3.1 Wages and salaries received in kind

3.1.0 Tables 1R and 1U of the Part II give estimates at all-India level, for items reported to have been received as wages or salaries in kind by at least 15 sample households during the reference period of 30 days, of

- (a) no. of sample households and estimated proportion of households reporting receipt of the item as wages or salaries in kind, and
- (b) for each MPCE class, average value of the item (or item group) received as wages or salaries in kind by households reporting receipt of any food or non-food item as

part of wages or salaries during the reference period of 30 days.

3.1.1 The tables reveal that goods and services most commonly received by Indian households in 1993-94 as wages or salaries in kind were **cooked meals, (prepared) tea** and, in rural areas, **rice, paddy, wheat, bidis, and atta**.

3.1.2 7.1% of rural households and 3.7% of urban households in India reported receipt of some wages or salaries in kind.

3.1.3 Receipt of some wages or salaries in the form of food was reported by 6.6% of rural households and 2.9% of urban households.

3.1.4 Among households reporting receipt of some wages or salaries in kind, the average value of such receipt was Rs.180 in rural areas and Rs.209 in urban areas. It may be noted that the rural-urban differential in this respect was much less than the rural-urban differential in respect of MPCE (Rs.281, rural, against Rs.458, urban)¹.

3.1.5 Of the average receipt of wages in kind per receiving household, food accounted for 91% (Rs.164 out of Rs.180) in rural areas but only 61% (Rs.128 out of Rs.209) in urban areas.

3.1.6 In rural areas, about Rs.100 of the average receipt of wages or salaries in kind was in the form of cereals.

¹See NSS report no. 402, *Level and Pattern of Consumer Expenditure*.

3.1.7 Average value of *non-food* goods and services received per receiving household as wages in kind or perquisites showed, broadly, a rise with increase in MPCE. But the pattern of variation with MPCE of value of food receipts, and value of all (food & non-food) receipts, was not so clear.

Statement 1 shows all-India estimates of average value of some important groups of consumption items received by households as wages or salaries in kind, and the number and estimated proportion of households reporting such receipt, separately for rural and urban India. *Averages are calculated per household reporting receipt of any food or non-food item as wages or salaries in kind.*

3.2 Gifts given and gifts received

3.2.0 Data on value of gifts were collected by interviewing each sample household both as a

giver and as a receiver of gifts. The all-India estimates obtained of per capita value of gifts as reported by "givers" and as reported by "receivers" are shown in Table 2 (R&U) and Table 3 (R&U) of the summary results respectively, separately for each MPCE class of households. Only those items are shown which were reported by at least 15 sample households.

3.2.1 The total value of gifts per capita exchanged by Indian households according to givers and receivers during a period of 30 days is given in Statements 2 and 3 respectively. Also shown is the break-up of this value into food and non-food components, and the value accounted by 5 important groups: cereals, beverages and processed food, clothing, footwear, and durable goods, and the number and estimated proportion of households reporting gifts in each of the forms.

GOODS AND SERVICES MOST COMMONLY RECEIVED AS WAGES IN KIND BY INDIAN HOUSEHOLDS, 1993-94

sl. no.	item	no. of receiving hhs*	sl. no.	item	no. of receiving hhs*

stainless steel utensils	65	**	50	**

*out of a total sample size of 69206 rural hhs and 46148 urban hhs; reference period=30 days

**reported by less than 15 hhs

3.2.2 The total monthly value of gifts per capita in rural areas comes to Rs.2.42 according to the givers and Rs.1.60 according to the receivers, against an average rural MPCE of Rs.281. In urban areas, the average value of gifts per person is Rs.1.90 according to the givers and Rs.2.34 according to the receivers, against an average urban MPCE of Rs.458 (vide NSS report no.402). Gifts thus constitute a very small expenditure in proportion to MPCE, the proportion being greater for rural areas of the country than for the urban.

3.2.3 The percentage of households reporting gifts received last month (rural: 5.1% ; urban: 4.1%) is, interestingly, appreciably higher than the percentage of households reporting gifts

given last month (rural:2.9%; urban:2.4%). The rural percentage of households is higher than the urban both according to the givers and according to the receivers. Also, the table above indicates that, in general, more donors than recipients are found of gifts which become part of the recipient's *possessions* (clothing, utensils, etc.), and more recipients than donors of gifts which the recipient uses up or consumes (food, *bidis*, *pan*). More than one kind of non-sampling error is probably at work here: recall lapse, unwillingness to report to a stranger the receiving of particular items such as durable goods, and deliberate suppression by informants of (to them) trivial incidents such as the "gift" of a *bidi* in the interests of keeping the interview

as short as possible. Note that the donor is, on the average, likely to be a richer person than the recipient and a small gift is likely to be a more trivial matter to him than to the recipient.

3.2.4 Clothing accounted for 57-58% of the value of all gifts according to the givers and about 47% of all gifts according to the receivers, in both rural and urban areas of the country. The five groups "cereals", "beverages and processed food", "clothing", "footwear", and "durable goods" together accounted in nearly all cases for 90% or more of the total value of gifts.

3.2.5 The most popular gift items in India in 1993-94 are listed in the table above.

3.2.6 Variation in the value of gifts given/

received over rural and urban MPCE classes (note that these are also "matched" fractile groups of the all-India rural and urban distributions of per capita consumption) is outlined in the table below. The rural data appear to suffer less from the effect of sampling fluctuations than the urban data. In rural areas the top three MPCE classes stand out as "net donors" of gifts. The bottom four classes, in both rural and urban areas, are "net receivers". The position of the 5th, 6th and 7th classes is somewhat different for rural and urban areas. In urban areas these classes appear to be, on the average, receiving two or three times as much as they are giving. The corresponding classes (or fractile groups) in rural areas appear to be giving nearly as much as they are receiving.

THE AVERAGE VALUE OF GIFT GIVEN AND RECEIVED FOR DIFFERENT MPCE CLASSES

MPCE class	rural		MPCE class	urban

Section 4

Expenditure on Ceremonies and Insurance

4.1 Average expenditure incurred on ceremonies and proportion of households reporting ceremonies performed during last 30 days

4.1.0 The household consumer expenditure schedule in the 50th round survey had a special block on ceremonies performed by the household during the last 30 days. Like the block on gifts and wages in kind, this block was canvassed in one-half of all sample households.

4.1.1 Expenditure on ceremonies was recorded under five broad heads: food, clothing and footwear, miscellaneous goods & services and consumer rents, durable goods, and other expenses. The detailed results, tabulated by MPCE class for each state and u.t., are given in Tables 4R and 4U of the Part II Survey results. *Note that the tables show average expenditure per household reporting ceremonies (households reporting no ceremonies are excluded from the calculation of average expenditure).*

4.1.2 Average expenditure incurred on ceremonies by households performing any ceremony during a period of 30 days, and its break-up by the five broad heads, is shown for each MPCE class of rural/urban India as a whole in Statement 4 and for rural and urban areas of each of the 15 major states in Statement 5. Also shown are the numbers and estimated

numbers of households in different MPCE classes/ Indian states reporting having performed any ceremony during the 30-day reference period.

4.1.3 The proportion of households reporting ceremonies performed last month was about 9 per 1000 in rural India and about 6 per 1000 in urban India (Statements 4 and 5).

4.1.4 In both rural and urban areas, the proportion of households reporting ceremonies increased with increase in MPCE level (Statement 4).

4.1.5 The average expenditure on ceremonies incurred by households performing any comes to Rs.4458 for rural India and Rs.3342 for urban India (Statements 4 and 5). Seen against the figures for average MPCE (Rs.281:rural; Rs.458:urban), the data appear to indicate that ceremonies impose a much greater financial burden on the average rural household than on the average urban household.

4.1.6 Food accounted for about a third of rural households' expenses on ceremonies and about 30% of urban households' expenditure. On the whole, the shares of the various components of expenditure did not differ greatly between rural and urban areas. The share of expenditure on durable goods was somewhat higher in urban areas.

4.1.7 Sampling fluctuations tended to

obscure the pattern of variation of average expenditure on ceremonies (and its various components) over the states, and also the pattern of variation over MPCE classes. Thus it is difficult to establish, on the basis of the data in Statement 4, that average expenditure on ceremonies increases with increase in MPCE (or the reverse).

4.2 Average monthly expenditure incurred on insurance premium and proportion of households reporting such expenditure during the last 365 days

4.2.0 The 50th round consumer expenditure schedule also recorded expenditure on insurance premium incurred by sample households during a one-year period preceding the date of survey. Estimates of average monthly expenditure on insurance premium by type of insurance, are presented in detail for rural and urban areas of all states and u.t.'s for 12 MPCE classes in Table 5 (R&U) of the Part II Survey results. *As in the case of expenditure on ceremonies, average expenditure on insurance premium is calculated per reporting household*

4.2.1 Average monthly expenditure incurred on insurance premium per reporting household, and its break-up by type of insurance, is shown for each MPCE class of rural/urban India as a whole in Statement 6 and for rural and urban areas of each of the 15 major states in Statement 7. Statement 6 also gives numbers and estimated numbers of reporting households (reporting payment of insurance premium *during last 365 days*) in different MPCE classes.

4.2.2 The different types of insurance on which data were separately collected were: life insurance, householder's comprehensive

insurance, fire and allied perils (only) insurance, burglary (only) insurance, personal accident (only) insurance, motor vehicle insurance, medical insurance, transit insurance, and other insurance.

4.2.3 It is observed from Statement 6 that the percentage of households incurring insurance expenditure was four times higher in urban areas (22%) than in rural areas (5.5%).

4.2.4 Among the different types of insurance, the predominant one was **life insurance** (reported by 18% of urban households and 5% of rural households). The other types were reported by less than 1% of rural households. Among urban households, 4.5% reported expenditure on account of motor vehicle insurance and a total of 4% households reported one or more of the other types.

4.2.5 At the all-india level, life insurance accounted for 85-90% of expenditure on insurance premium in both rural and urban areas. The relative importance of life insurance was least in Punjab and rural Rajasthan (Statement 7).

4.2.6 Motor vehicle insurance was especially important in Punjab, where it accounted for nearly 30% of insurance expenditure in rural areas and nearly 14% in urban areas

On the whole, monthly expenditure on insurance increased with an increase in MPCE level, though the pattern is marred by sampling fluctuations.

4.2.8 Estimated numbers of households reporting insurance expenditure rose rapidly with an increase in MPCE level (Statement 6) in both rural and urban areas.

STATEMENT 4: BREAK-UP OF AVERAGE EXPENDITURE INCURRED ON CEREMONIES PER REPORTING HOUSEHOLD DURING A PERIOD OF 30 DAYS BY BROAD EXPENDITURE HEADS FOR DIFFERENT MPCE CLASSES

A Note on Reported Adequacy of Food Intake in India: NSS 50th Round (1993-94)

Section 1

Introduction

1.0 Background : The 50th round of NSS was the fifth quinquennial survey on consumer expenditure. The previous four quinquennial surveys were the 27th (Oct. 1972 - Sept. 1973), the 32nd (July 1977 - June 1978), the 38th (Jan-Dec. 1983) and the 43rd (July 1987- June 1988) rounds of NSS. In other rounds too, consumer expenditure inquiry on a lesser scale is being carried out starting from the 42nd round (1986-87) onwards along with the main topic of enquiry. From the 45th round onwards the subject coverage of this schedule has been broadened to include some important aspects of questions on employment so that an annual series of consumer expenditure and employment data becomes available. While some of these smaller-scale surveys are conducted over a period of twelve months or six months, the quinquennial (full-scale) surveys have all been of one year duration.

1.1 In the quinquennial surveys, in each sample household, two separate schedules are canvassed - sch.1.0 for consumer expenditure and sch.10 for employment - unemployment situation, enabling thereby cross-tabulation of variates on consumer expenditure and employment - unemployment. The present report, however, is based on schedule 1.0 only, enlighting primarily on the availability of sufficiency of food for the Indian households.

1.2 Geographical Coverage: The survey period of the 50th round was from July 1993 to June 1994. The survey was supposed to be spread the whole of the Indian Union except Ladakh and Kargil districts of Jammu & Kashmir, 768 interior villages of Nagaland and 172 villages in Andaman & Nicobar Islands which remain inaccessible throughout the year. However, certain districts of Jammu & Kashmir viz., Doda, Anantnag, Pūlwama, Srinagar, Badgam, Baramullah and Kupwara, and Amritsar district of the stste of Punjab, had to be excluded from the survey coverage due to unfavourable field conditions.

1.3 Sample Size: A maximam of ten households were selected for survey in each sample village / urban block. In all, 115354 households, spread over 6951 sample villages and 4650 sample blocks were interviewed.

1.4 Survey Period:The survey period of one year was divided into four sub- rounds of three months each with allocation of equal number of sample villages and blocks to each of the four sub-rounds viz.,

sub-round 1	:	July-Sept'93;
sub-round 2	:	Oct.-Dec'93;
sub-round 3	:	Jan.-Mar'94;
sub-round 4	:	Apr.-June'94

1.5 Details on the availability of adequacy of food by the members of the Indian household as revealed from the present round of survey are presented in this report.

1.6 With a view to study the trend, the estimates of availability of adequate food of the present survey have been compared with the estimates of the third quinquennial survey on consumer expenditure conducted during NSS 38th round, 1983.

1.7 Basing on the combined sample (both of sub-sample 1 & 2) data, this document summarises the detailed results of the survey on the aforesaid matter. The Sampling Design and Estimation Procedure followed in this survey round is given in the following Section. Section Three briefly elaborates on the important concepts and definitions adopted in the survey and used in this report and the survey findings are discussed in Section Four. The collection of detailed data tables are given in Part II, Summary Results.

Section Two

Sample Design & Estimation procedure

2.0 Sample Design : A stratified two-stage sampling design was adopted, with census villages as first stage units (fsu's) in the rural sector and Urban Frame Survey (UFS) blocks in the urban, except for a few newly declared towns of the 1991 census, for which UFS frames were not available, and census enumeration blocks (EB's) were used as first stage units. Households formed the second stage units in both rural and urban sectors.

2.1 Sampling frame for fsu's : In the rural sector, the sampling frame was provided sometimes by the 1981 census list of villages and sometimes by the 1991 census list of villages, depending on the sub-round (see para 1.4) and the state/union territory being surveyed, as follows.

2.1.1 In the following areas of rural India (hereafter referred to as **Group A areas**), the **1981** census lists of villages served as the sampling frame for all 4 sub-rounds :

Jammu & Kashmir - where the 1991 census was not conducted.

Agra district of U.P. and Durg, Sagar and Morena districts of M.P. - for which the available information for 1991 was incomplete.

2.1.2 In the following areas of rural India (hereafter referred to as **Group B areas**), the **1991** census lists of villages served as the sampling frame for all 4 sub-rounds :

Andhra Pradesh, Assam, Kerala, Orissa, West Bengal & Chandigarh. U.P. and M.P. (excepting Group A areas).

2.1.3 In the remaining states/u.t.'s of rural India (hereafter referred to as **Group C areas**), the **1981** census lists of villages were used as sampling frame for **sub-round 1** and the **1991** census lists used for **sub-rounds 2 to 4** in order to make use of the latest available information in the sample selection process.

2.1.4 For Nagaland, the villages situated within 5 km of a bus route constituted the

sampling frame. For the Andaman & Nicobar Islands, the villages which remain inaccessible throughout the year were, as usual, excluded from the sampling frame.

2.1.5 In the urban sector, the lists of NSS Urban Frame Survey (UFS) blocks were the sampling frames used in most cases. However, 1991 census house listing enumeration blocks were considered as the sampling units for some of the newly declared towns of the 1991 population census, for which UFS frames were not available

2.2 **Stratification** : As usual, each state/union territory (u.t.) was divided into one or more agro-economic regions by grouping contiguous districts which are similar with respect to population density and crop pattern. In Gujarat, however, some districts were sub-divided for the purpose of region formation on the basis of location of dry areas and the distribution of tribal population in the state. The total number of regions formed in the whole of India was 78.

2.2.1 In the rural sector, within each region, each district normally formed a separate stratum. However, if the census population of the district according to the sampling frame used exceeded 1.8 million / 2 million (depending on whether 1981 or 1991 census frame was used), the district was split into two or more strata by grouping contiguous tehsils. In Gujarat, however, in the case of districts extending over more than one region, the portion of a district falling in each region constituted a separate stratum even if the rural population of the district as a whole was less than 1.8 million / 2 million.

2.2.2 In the urban sector, strata were formed, again within NSS regions, on the basis of town

stratum	composition
1	towns with population less than 50000
2	towns with population 50000 - 199999
3	towns with population 200000 - 399999
4	towns with population 400000 - 999999 - affluent areas
5	towns with population 400000 - 999999 - other areas
6	a single city (if any) with population 1 million or more : affluent areas
7	a single city (if any) with population 1 million or more : other areas
8	another city (if any) with population 1 million or more : affluent areas
9	another city (if any) with population 1 million or more : other areas

population. In order to be able to allocate a larger proportion of the sample to the affluent section of society and thus improve the precision of the overall estimate of consumer expenditure, the usual first-stage stratification procedure was modified as follows. Urban blocks in towns with census population 400,000 or more were placed in different strata depending on whether they belonged to the "affluent" area of the town or not - the information on affluent areas being supplied by the regional/sub-regional field offices of NSSO. Full details of urban stratification are given below.

2.3 **Allocation of sample** : The first-stage sample size for any state/union territory of India was allotted to the rural and urban sectors in consideration of the relative sizes of the rural and urban population with double weightage to the urban sector.

2.3.1 Within the **urban** sector of a state/u.t.,

allocation of the sample to the different urban strata was done in proportion to stratum population with double weightage to affluent strata - that is, strata 4,6 & 8 (see para 2.2). Stratum level allocations were adjusted to multiples of 8 as far as possible so as to have equal allocations for each sub-sample-sub-round combination.

2.3.2 Within the **rural** sector of a state/u.t., allocation of the sample to the different rural strata was done as follows.

2.3.3 For Group B areas (see para 2.1), the state/u.t. level rural sample was allocated to the different rural strata in proportion to 1991 census population. For other areas (Group A and Group C), allocation was initially made on the basis of 1981 census population. Stratum level allocations were adjusted to multiples of 8 as far as possible so as to have equal allocations for each sub-sample-sub-round combination.

2.3.4 However, for Group C areas, the original allocations for sub-rounds 2 to 4 were revised as follows. The total state/u.t. level allocation for sub-rounds 2 to 4 combined - 75% of the total as 25% had gone to sub-round 1 - was re-allocated to the rural strata in proportion to stratum population as per **1991** census. Stratum level allocations were adjusted to multiples of 6 as far as possible so as to have equal allocations for the remaining sub-sample-sub-round combinations.

2.4 **Selection of fsu's** : Sample villages - except in Arunachal Pradesh - were selected by PPS circular systematic sampling (with population as the size variable) from the appropriate sampling frame as explained in para 2.1, in the form of two independent sub-samples. Sample blocks were selected by

ordinary (equal probability) circular systematic sampling, also in the form of two independent sub-samples.

2.4.1 In Arunachal Pradesh the sample of villages was drawn by a cluster sampling procedure. The field staff were supplied with a list of sample "nucleus" villages and were advised to select clusters of villages - building up each cluster around a nucleus village - according to prescribed guidelines. The nucleus villages were selected circular systematically with equal probability, in the form of two independent sub-samples.

2.5 **Selection of hamlet-groups/ sub-blocks:**

To reduce workload the following procedure was adopted in drawing up the second-stage sampling frame. Larger sample villages and blocks were divided - according to usual NSS practice - into a suitable number of "hamlet-groups"/"sub-blocks" of roughly equal population content : the second-stage sampling frame was constituted of the households belonging to only two of these hamlet-groups, selected circular systematically, in case of sample villages, and one randomly selected sub-block in case of sample blocks (instead of the whole village/block). No hamlet-group formation was, however, done in Arunachal Pradesh. In Kerala, practical difficulties arose in hamlet-group formation during sub-round 1. These were resolved by selecting, instead of two hamlet-groups, two EB's from the constituent EB's of large villages.

2.6 **Selection of households** : The affluent classes of society have expenditure levels spread over a very wide section of the consumer expenditure range. As a result, the contribution of these classes to the sampling error of a consumer expenditure survey is large compared

to that of an equal-sized chunk of population belonging to the more homogeneous "middle classes" (say). To improve the efficiency of consumer expenditure estimates, it was decided that the second-stage sampling frames ought to be stratified in such a way as to be able to allocate a larger proportion of the sample to the affluent sections of the population wherever they could be located.

2.6.1 Rural : In sample villages, households in the second-stage sampling frame were divided into two strata as follows. Households - if any - exhibiting signs of affluence such as the possession of any of a specified list of assets including land in excess of a certain specified area, or a member holding a good salaried job or belonging to a paying profession such as that of a doctor or advocate, were designated "affluent households" and the top 10 such households (subject to availability) placed in stratum 1. The remaining households formed second-stage stratum 2. **Two** households were selected circular systematically from second-stage stratum 1. From second-stage stratum 2, **eight** households were selected circular systematically after arranging the households in the stratum by "means of livelihood"; this meant that households "self-employed in agriculture" were placed first, followed by "rural labour" households, and then the "others". Further, the households under "others" were arranged in five different land-possessed classes to ensure spread of the sample over households of different economic statuses.

2.6.2 Urban : In sample blocks, households with monthly per capita consumer expenditure (as reported at the time of household listing) Rs. 1200 or more (Rs. 1500 or more in towns

with population one million and above) were placed in second-stage stratum 1 and the rest in second-stage stratum 2. In sample blocks belonging to first-stage strata 4,6 & 8 (affluent areas of towns with population 4 lakhs or more), as many as **four** sample households were selected for survey from second-stage stratum 1 and **six** from second-stage stratum 2. In all strata other than those numbered 4,6 & 8, **two** sample households were selected from second-stage stratum 1 and **eight** from second-stage stratum 2. In each case the sample of households, for each second-stage stratum, was drawn circular systematically with a random start. The households in second-stage stratum 2 were, prior to sample selection, placed in eight different groups and the different groups of households placed one after another in a specified order to ensure spread of the sample **over the different groups**. The grouping was done on considerations of means of livelihood (self-employed / regular wage or salary earning / casual labour / others) and household monthly per capita consumer expenditure.

2.7 Sample size : This report covered, in all, 115354 households spread over 11601 sample villages/blocks. The number of sample villages and blocks allotted and surveyed, and the number of sample households and persons surveyed, are given for different state/u.t.'s and all-India in Statement 0, separately for rural and urban sectors.

2.8 Estimation Procedure

2.8.1 Estimation of aggregates at sub-sample level : Aggregates are first estimated at sub-sample level according to the following estimation formulae, where \hat{y} denotes the estimate - based on one sub-sample - of the

aggregate of a given characteristic Y for a sector of a state/u.t.

For the **rural sector** of a state/u.t. **other than Arunachal Pradesh,**

$$\hat{Y} = \sum_s \frac{1}{n_s} \sum_i \frac{P_{si} D_{si}^*}{p_{si}} \sum_{t=1}^2 \frac{H_{sit}}{h_{sit}} \sum_{j=1}^{h_{sit}} y_{sitj}$$

For the **rural sector** of **Arunachal Pradesh,**

$$\hat{Y} = \sum_s \frac{1}{n_s} \sum_{i=1}^{n_s} N_{si} \sum_{t=1}^2 \frac{H_{sit}}{h_{sit}} \sum_{j=1}^{h_{sit}} y_{sitj}$$

For the **urban sector** of a state/u.t.,

$$\hat{Y} = \sum_s \frac{N_s}{n_s} \sum_{i=1}^{n_s} D_{si} \sum_{t=1}^2 \frac{H_{sit}}{h_{sit}} \sum_{j=1}^{h_{sit}} y_{sitj}$$

where

- y : observed value of the same characteristic in a sample household
- s : stratum suffix
- i : sample village/block suffix
- t : second-stage stratum suffix
- j : sample household suffix
- D : number of hamlet-groups/ sub-blocks formed in the surveyed village/block
- H : number of households listed in the second-stage sampling frame
- h : number of sample households surveyed

p : population of sample village as in the sampling frame

N : for the urban sector, number of blocks in the sampling frame

n : number of sample villages/blocks surveyed in this sub-sample

Psi : population of the s-th stratum as per frame used in the selection of i-th sample village of the stratum

Nsi : for Arunachal Pradesh, number of sample villages in the sampling frame for s-th stratum which was used in selection of i-th sample village of the stratum

D* : equals 1, if D = 1
equals D/2 if D > 1

2.8.2 Estimation of aggregates for the combined sample (pooling sub-samples): The combined sample estimate of an aggregate is obtained as the simple average of the corresponding sub-sample estimates.

2.8.3 Estimates of ratios : The estimate of a ratio of the form $R = Y/X$, where Y and X are the population aggregates of two characters, is obtained as

$$\hat{R} = \frac{\hat{Y}}{\hat{X}}$$

where \hat{Y} and \hat{X} are estimates of Y and X obtained according to the procedure laid down in paras 2.8.1 and 2.8.2. Examples of ratio estimates are rates and percentages.

Section 3

Concepts and Definitions

3.0 The concepts & definitions as followed in the household consumer expenditure survey during 50th round are broadly in lines of recent past rounds. A few of those relevant to this report are given below :

3.1 **Household** : A group of persons normally living together and taking food from a common kitchen constitutes a household. The qualification "normally" extends to cover only temporary stay aways but not temporary visitors, in the group. Thus a member residing outside, in a hostel, for studies is counted outside the household of the remaining family member(s), but a resident employee or resident domestic servant or paying guest (but not just a tenant in the house) is included in the employer/host's household. Among the twin criterion "Living together" is usually stressed upon rather than "sharing food from a common kitchen" in drawing the boundaries of a household in case both of them cannot be accommodated together due to mutual conflict; however, in the special case of a person taking food from the common family kitchen while regularly spending nights somewhere else (say in a shop or in a different house for sleeping) due to reasons of security of the shop or other insufficiencies in the family household premises, the household formed by such a person's family members is taken to include the person also. Each inmate of a mess, hotel,

boarding and lodging house, hostel, etc. is considered as a single-member household except that a family living in a hotel (say) is considered as one household only; similar condition being applicable to residential staff of such establishments.

3.2 **Household size** : The size of a household is a complete count of the household members.

3.3 **Household consumer expenditure** : The expenditure incurred by a household on domestic consumption during the reference period is the household's consumer expenditure. The household consumer expenditure is the sum total of the monetary values of consumption of various groups of items namely (i) food, pan (betel leaves), tobacco, intoxicants and fuel & light, (ii) clothing and footwear and (iii) miscellaneous goods and services and durable articles.

3.3.1 For groups (i) and (ii), the total value of consumption is derived by aggregating the monetary value of goods actually consumed during the reference period. An item of clothing and footwear would be considered to have been consumed if it is brought into maiden or first use during the reference period. The consumption may be out of (a) purchases made during the reference period or earlier; (b) home grown stock; (c) receipt in exchange of goods and services; (d) any other receipt like gift,

charity, borrowing and (e) free collection. Home produce is evaluated at the ex farm or ex factory rate. For evaluating the consumption of the items of group (iii) i.e. items categorised as miscellaneous goods and services and durable articles, a different approach is followed. In this case, total amount of money spent during the reference period for the purchase of goods and services is treated as consumption expenditure.

3.3.2 It is pertinent to mention here that the consumer expenditure of a household on food items relates to the actual consumption by the normal resident members of the household and also by the occasional guests & visitors whether during celebrations or otherwise. Transfer payments like charity, loan advance, etc. made by the household are not reconsidered to avoid duplicacy while counting them in payer household as consumption for items of groups (i) and (ii), since transfer receipts of these items have been taken into account there. However, the item "cooked meals" is an exception to the rule. Meals prepared in the household kitchen and provided to the employees and/or others would automatically get included in domestic consumption of employer (payer) household. There is a practical difficulty of estimating the quantities and values of individual items used for preparing the meals served to employees or to others. Thus, to avoid double counting, cooked meals received as perquisites from employer household or as gift or charity are not recorded in the recipient household. As a general principle, cooked meals purchased from the market for consumption of the normal resident members and for guests and employees

will also be recorded in the purchaser household.

3.3.3 The aforementioned procedure by which value of cooked meals served to others is accounted for in the expenditure of the serving households only leads to bias-free estimates of average per capita consumption as well as total consumer expenditure. The variation of the number of donors and recipients of free cooked meals are likely to be in opposite directions over the expenditure classes. As a matter of fact most of the donors of cooked meals will be in the upper MPCE classes whereas most of the recipients will be in the lower ones. The nutritional intake derived from the consumer expenditure survey data need to be presented taking care of this aspect.

3.4 **Reference period** : Consumption data appearing in this report were all collected with a reference period of "last 30 days", i.e. the 30 days just preceding the date of survey. The reference period used for the survey, in other words, was a "moving" one, varying from one household to another depending upon the day of canvass.

3.5 **Monthly per capita expenditure (MPCE)** : For a household, this is the total household consumer expenditure during a period of 30 days subdivided by household size. A person's MPCE is understood to be, the figure derived on the household to which he/she belongs.

3.6 **MPCE classes** : It is customary in NSS consumer expenditure reports, to present various estimates, including and state and all-India level values of different indicators, socio-

economic or else like nutrition related and distributions of households and persons over different socio-economic classes and calorie intake level formed basing on categorisation of the population as per monthly expenditure per capita i.e. MPCE. As regards population during the 50th round, 12 categories were drawn up in each sector - rural and urban - as follows. For the rural (urban) sector, the class limits of MPCE were so chosen that each class, excepting for the two pair of classes one each at the ends, approximately contained an estimated 10% of the rural (urban) population, while the remaining four classes each contained an estimated 5% of the population. Some adjustments were, however, made to keep some class limits common between the rural and urban sectors. Tabulation of results by MPCE class from the 43rd to the 49th round of NSS, incidentally, was done using MPCE classes derived in a similar way, using 43rd round MPCE data. In other words, the present updation of classification on MPCE is second to the one made during the 43rd round.

3.6.1 The classification evolved now for the two sectors of population is as follows:

MPCE Level	Rural (Rs.)	Urban (Rs.)
1.	below 120	below 160
2.	120 - 140	160 - 190
3.	140 - 165	190 - 230
4.	165 - 190	230 - 265
5.	190 - 210	265 - 310
6.	210 - 235	310 - 355
7.	235 - 265	355 - 410
8.	265 - 300	410 - 490
9.	300 - 355	490 - 605
10.	355 - 455	605 - 825
11.	455 - 560	825-1055
12.	560 & above	1055 & above

3.7 Perception of household regarding sufficiency of food: When the reported consumption during the period of reference does not reveal that the household members are getting sufficient feed then the question "whether all members of the household get two square meals a day" was put to the respondent who has got a clear understanding of the implications.

3.7.1 Figures within parenthesis indicate that number per thousand households to whom the question has been put specifically.

3.7.2 Only those calendar months of the preceding year have been recorded, during which adequate food were not available to all members of the household.

Section 4

Survey Findings

4.0 This chapter deals with the distribution of households by availability of adequate food, as revealed from the 50th round survey. A question was asked to the sample households/informants whether the members of the households got adequate food to eat ; throughout the year, during only some months of the year or not usually. This question is not relevant to those persons reported consumption would obviously indicate that they get sufficient food to eat. Additional question was asked to those households, whose reported availability of sufficient food only in some months of the year. Information on the calendar months in which all members of the households did not have adequate food, was recorded for such households.

4.0.1 Observed trends on the availability of adequate food over the decade (1983 to 1993-94) are discussed first which will be followed by the detailed discussion on the results of the current NSS quinquennial round in the following paragraphs.

4.1 Observed trends in the availability of adequate food over NSS rounds

4.1.1 Percentage distribution of households by availability of adequate food as per the two quinquennial NSS rounds, viz. 38th (1983) and 50th (1993-94) rounds, is shown in charts 1R and 1U for rural and urban India respectively.

4.1.2 An increase in the proportion of

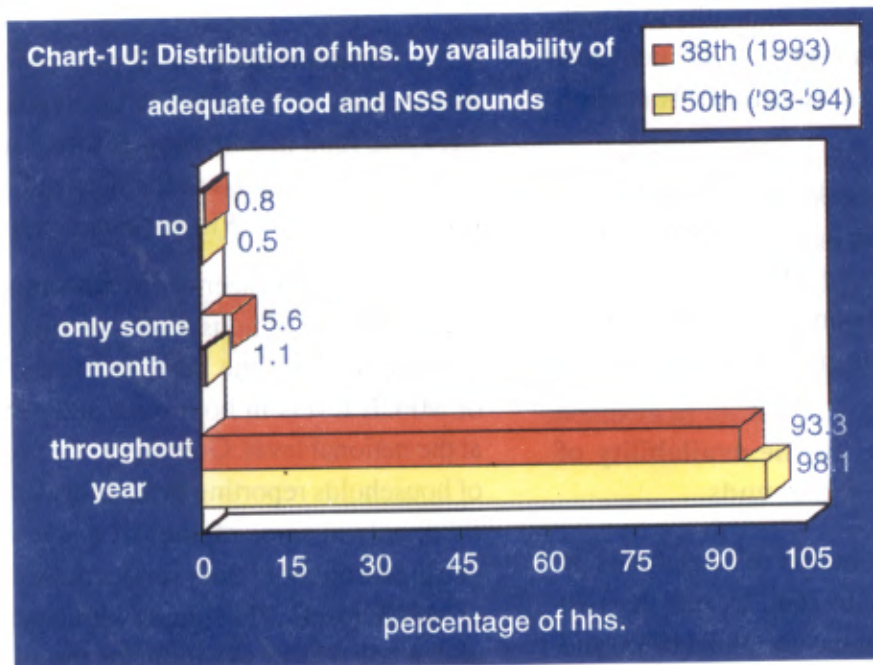

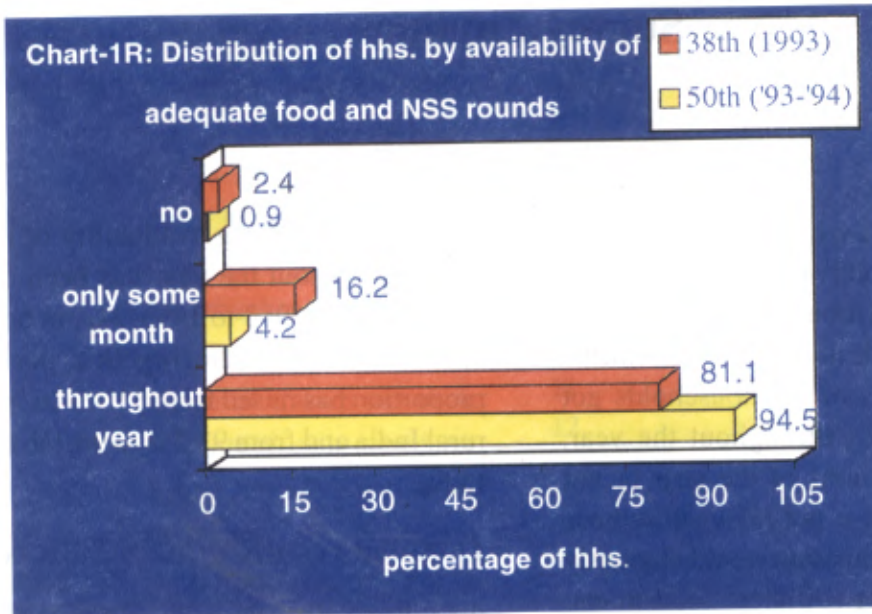

households reporting availability of adequate food, throughout the year has been observed for the period 1983 to 1993-94, , in both rural and urban areas. During this period, the proportion has raised from 81.1% to 94.5% for rural India and from 93.3% to 98.1% for urban India.

Detailed results of NSS 50th round

4.2 Per thousand distribution of households by availability of adequate food (i) for each MPCE class at the national level and (ii) for each of the 15 major states

4.2.1 **Statements 1 and 2** give per thousand distribution of households by availability of adequate food in both rural & urban sectors (i) for each MPCE class at the national level and (ii) for each of the 15 major states, respectively.

4.2.2 It may be seen from **statement 1** that the proportion of households getting adequate food, throughout the year, increases with rise of MPCE levels in both rural and urban areas at the national level. Obviously, the proportions of households reporting availability of adequate food, only in some months of the year and not getting throughout the year decreases with rise of MPCE levels. The figures within parentheses under col. (2) to (4) indicate the number of households to whom this question of sufficiency of food was actually asked by the investigators.

STATEMENT -1: PER THOUSAND DISTRIBUTION OF HOUSEHOLDS BY AVAILABILITY OF TWO SQUARE MEALS A DAY FOR EACH MPCE CLASS AT THE NATIONAL LEVEL

4.2.3 It is observed from **statement 2** that in rural sector, the percentage of households getting adequate food throughout the year is less than that of urban sector at national level as well as in all the major states excepting Punjab. At the national level, around 95% of the households in the rural sector as compared to around 98% in urban sector do get adequate food throughout the year. In the states of Orissa (84%) and West Bengal (86%), less than 90% of the households get adequate food in the rural sector throughout the year. The states where maximum percentage of households get this basic requirement of food almost fulfilled are Punjab, Haryana (both rural and urban areas) and Rajasthan (urban area).

4.2.4 It is observed that at the national level, 4.2% of the households in **rural** as against 1.1% of the households in **urban** get adequate food only in some months of the year. In the rural sector, more than 10% of the households in the states of Orissa and West Bengal get adequate food only during some months of the calendar year.

4.2.5 The households in which all members do not get adequate food throughout the year is 3% each in Assam & West Bengal in rural sector, against the corresponding figure of 0.9% for rural India.

4.3 Number per thousand households reporting non-availability of adequate food by calendar month

4.3.1 **Statements 3 & 4** present number of

households reporting non-availability of adequate food by calendar months per thousand households (i) for each MPCE class at the national level and (ii) for each of the 15 major states, respectively.

4.3.2 Non-availability of adequate food is prominent during the months of May to October in rural India and is acute for the households falling in the lower MPCE classes, as is evident from **statement 3**. This feature of non-availability of adequate food is observed to be acute in the months of July to September in urban India for the households belonging to the lower few MPCE classes.

4.3.3 **Statement 4** shows the number per thousand households reporting non-availability of adequate food by calendar month in both the sectors at the state & national level. It is found that at the national level, proportion of households reporting non-availability of adequate food in different calendar months is more in rural areas than urban areas.

4.3.4 This problem is **very acute** in the **rural areas of Assam, Bihar, Kerala Orissa and West Bengal**. The rural areas of Punjab, Rajasthan and to some extent Haryana are almost free from the clutch of the problem.

4.3.5 In the **urban sector**, non-availability of adequate food is prominent in the states of Kerala, Orissa & West Bengal. Again in the states of Rajasthan, Haryana & Punjab this problem is almost negligible.

A Note on Consumption of Tobacco in India, NSS 50th Round (1993-94)

Section 1

Introduction

1.0 The NSSO conducted its fifth quinquennial survey of household consumer expenditure in India during 1993-94. The survey was spread over the entire geographical area of the country. Interviews were conducted of 115354 households in 6951 villages and 4650 urban blocks. The present document is one of a series of documents based on the survey.

1.1 The issue releases data on tobacco consumption habits of the Indian population as distinct from data on the quantity and value of tobacco consumption. Data on quantity and value of per capita tobacco consumption in India was released earlier in Sarvekshana, Vol. XX, No. 2, Issue No. 69 (Oct-Dec 96): Consumption of Some Important Commodities in India.

1.2 Four forms of tobacco consumption were

distinguished in the survey schedule: smoking; chewing of tobacco (zarda, dokta, etc.); use of snuff; and the use of burnt tobacco powder or paste. For each member of the households surveyed, it was ascertained from the informant (in nearly all cases a member of the household) whether the person had the habit of consuming tobacco in any of these forms, and if so, whether the habit was regular or casual.

1.3 Based on the data thus obtained, estimates were generated of proportions of persons of two sexes, ages and social groups with a regular/casual habit of tobacco consumption, separately for the four different forms of consumption, in rural and urban areas of each state and union territory of India.

1.4 Such data were last released for the 43rd round survey of NSS, which related to the year 1987-88.

Section 2

Sample design and Concepts & Definitions

2.0 **Sample Design:** A stratified two-stage sampling design was adopted, with census villages as first stage units (fsu's) in the rural sector and Urban Frame Survey (UFS) blocks in the urban, except for a few newly declared

towns of the 1991 census, for which UFS frames were not available, and census enumeration blocks (EB's) were used as first stage units. Households formed the second stage units in both rural and urban sectors.

2.1 The survey period of one year was divided into four sub-rounds of three months each and equal numbers of sample villages and blocks allotted to each sub-round.

	1	July - Sept 1993
sub-	2	Oct - Dec 1993
rounds	3	Jan - Mar 1994
	4	Apr - June 1994

2.2 **Sampling frame for fsu's :** In the rural sector, the sampling frame was provided sometimes by the **1981** census list of villages and sometimes by the **1991** census list of villages, depending on the sub-round (see para 2.1) and the state/union territory being surveyed, as follows.

2.2.1 In the following areas of rural India (hereafter referred to as **Group A areas**), the **1981** census lists of villages served as the sampling frame for **all 4 sub-rounds** :
Jammu & Kashmir - where the 1991 census was not conducted.

Agra district of U.P. and Durg, Sagar and Morena districts of M.P. - for which the available information for 1991 was incomplete.

2.2.2 In the following areas of rural India (hereafter referred to as **Group B areas**), the **1991** census lists of villages served as the sampling frame for **all 4 sub-rounds** :
Andhra Pradesh, Assam, Kerala, Orissa, West Bengal & Chandigarh.
-U.P. and M.P. (excepting Group A areas).

2.2.3 In the remaining states/u.t.'s of rural India (hereafter referred to as **Group C areas**), the **1981** census lists of villages were used as sampling frame for **sub-round 1** and the **1991** census lists used for **sub-rounds 2 to 4** in order to make use of the latest available information in the sample selection process.

2.2.4 For Nagaland, the villages situated within 5 km of a bus route constituted the sampling frame. For the Andaman & Nicobar Islands, the villages which remain inaccessible throughout the year were, as usual, excluded from the sampling frame.

2.2.5 In the urban sector, the lists of NSS Urban Frame Survey (UFS) blocks were the sampling frames used in most cases. However, 1991 census house listing enumeration blocks were considered as the sampling units for some of the newly declared towns of the 1991 population census, for which UFS frames were not available.

2.3 **Stratification:** As usual, each state/union territory (u.t.) was divided into one or more agro-economic regions by grouping contiguous districts which are similar with respect to population density and crop pattern. In Gujarat, however, some districts were subdivided for the purpose of region formation on the basis of location of dry areas and the distribution of tribal population in the state. The total number of regions formed in the whole of India was 78.

2.3.1 In the rural sector, within each region, each district normally formed a separate stratum. However, if the census population of the district according to the sampling frame used exceeded 1.8 million / 2 million (depending on whether 1981 or 1991 census frame was used), the district was split into two or more strata by grouping contiguous tehsils. In Gujarat, however, in case of districts extending over more than one region, the portion of a district falling in each region constituted a separate stratum even if the rural population of the district as a whole was less than 1.8 million / 2 million.

stratum	composition
1	towns with population less than 50000
2	towns with population 50000 - 199999
3	towns with population 200000 - 399999
4	towns with population 400000 - 999999 - affluent areas
5	towns with population 400000 - 999999 - other areas -
6	a single city (if any) with population 1 million or more : affluent areas
7	a single city (if any) with population 1 million or more : other areas
8	another city (if any) with population 1 million or more : affluent areas
9	another city (if any) with population 1 million or more : other areas

2.3.2 In the urban sector, strata were formed, again within NSS regions, on the basis of town population. In order to be able to allocate a larger proportion of the sample to the affluent section of society and thus improve the precision of the overall estimate of consumer expenditure, the usual first-stage stratification procedure was modified as follows. Urban blocks in towns with census population 400,000 or more were placed in different strata depending on whether they belonged to the "affluent" area of the town or not - the information on affluent areas being supplied by the regional/sub-regional field offices of NSSO. Full details of urban stratification are given below.

2.4 Following usual NSS practice, the sample of villages and blocks in which the enquiry was carried out was drawn in the form of two independent **sub-samples**. Either of these sub-

samples could be used to generate a valid set of estimates which might be regarded as the provisional results of the survey until such time as the final results, based on the entire sample, were available.

2.5 Allocation of sample: The first-stage sample size for any state/union territory of India was determined on the basis of its investigator strength and the expected workload per investigator. This sample was first allotted to the rural and urban sectors in consideration of the relative sizes of the rural and urban population with double weightage to the urban sector.

2.5.1 Within the **urban** sector of a state/u.t., allocation of the sample to the different urban strata was done in proportion to stratum population with double weightage to affluent strata - that is, strata 4,6 & 8 (see para 2.3.2). Stratum level allocations were adjusted to multiples of 8 as far as possible so as to have equal allocations for each sub-sample-sub-round combination.

2.5.2 Within the **rural** sector of a state/u.t., allocation of the sample to the different rural strata was done as follows.

2.5.3 For Group B areas (see para 2.2), the state/u.t. level rural sample was allocated to the different rural strata in proportion to 1991 census population. For other areas (Group A and Group C), allocation was initially made on the basis of 1981 census population. Stratum level allocations were adjusted to multiples of 8 as far as possible so as to have equal allocations for each sub-sample-sub-round combination.

2.5.4 However, for Group C areas, the original allocations for sub-rounds 2 to 4 were

revised as follows. The total state/u.t. level allocation for sub-rounds 2 to 4 combined - 75% of the total as 25% had gone to sub-round 1 - was re-allocated to the rural strata in proportion to stratum population as per **1991** census. Stratum level allocations were adjusted to multiples of 6 as far as possible so as to have equal allocations for the remaining sub-sample-sub-round combinations.

2.6 Selection of fsu's : Sample villages - except in Arunachal Pradesh - were selected by PPS circular systematic sampling (with population as the size variable) from the appropriate sampling frame as explained in para 2.2, in the form of two independent **sub-samples**. Sample blocks were selected by ordinary (equal probability) circular systematic sampling, also in the form of two independent sub-samples.

2.6.1 In Arunachal Pradesh the sample of villages was drawn by a cluster sampling procedure. The field staff were supplied with a list of sample "nucleus" villages and were advised to select clusters of villages - building up each cluster around a nucleus village - according to prescribed guidelines. The nucleus villages were selected circular systematically with equal probability, in the form of two independent sub-samples.

2.7 Selection of hamlet-groups/sub-blocks: To reduce workload the following procedure was adopted in drawing up the second-stage sampling frame. Larger sample villages and blocks were divided - according to usual NSS practice - into a suitable number of "hamlet-groups"/"sub-blocks" of roughly equal population content : the second-stage sampling frame was constituted of the households

belonging to only two of these hamlet-groups, selected circular systematically, in case of sample villages, and one randomly selected sub-block in case of sample blocks (instead of the whole village/block). No hamlet- group formation was, however, done in Arunachal Pradesh. In Kerala, practical difficulties arose in hamlet-group formation during sub-round 1. These were resolved by selecting, instead of two hamlet-groups, two EB's from the constituent EB's of large villages.

2.8 Selection of households : The affluent classes of society have expenditure levels spread over a very wide section of the consumer expenditure range. As a result, the contribution of these classes to the sampling error of a consumer expenditure survey is large compared to that of an equal-sized chunk of population belonging to the more homogeneous "middle classes" (say). To improve the efficiency of consumer expenditure estimates, it was decided that the second-stage sampling frames ought to be stratified in such a way as to be able to allocate a larger proportion of the sample to the affluent sections of the population wherever they could be located.

2.8.1 Rural : In sample villages, households in the second-stage sampling frame were divided into two strata as follows. Households - if any - exhibiting signs of affluence such as the possession of any of a specified list of assets including land in excess of a certain specified area, or a member holding a good salaried job or belonging to a paying profession such as that of a doctor or advocate, were designated "affluent households" and the top 10 such households (subject to availability) placed in stratum 1. The remaining households formed second-stage stratum 2. **Two** households were

selected circular systematically from second-stage stratum 1. From second-stage stratum 2, **eight** households were selected circular systematically after arranging the households in the stratum by "means of livelihood"; this meant that households "self-employed in agriculture" were placed first, followed by "rural labour" households, and then the "others". Further, the households under "others" were arranged in five different land-possessed classes to ensure spread of the sample over households of different economic statuses.

2.8.2 Urban : In sample blocks, households with monthly per capita consumer expenditure (as reported at the time of household listing) Rs 1200 or more (Rs 1500 or more in towns with population one million and above) were placed in second-stage stratum 1 and the rest in second-stage stratum 2. In sample blocks belonging to first-stage strata 4,6 & 8 (affluent areas of towns with population 4 lakhs or more), as many as **four** sample households were selected for survey from second-stage stratum 1 and **six** from second-stage stratum 2. In all strata other than those numbered 4,6 & 8, **two** sample households were selected from second-stage stratum 1 and **eight** from second-stage stratum 2. In each case the sample of households, for each second-stage stratum, was drawn circular systematically with a random start. The households in second-stage stratum 2 were, prior to sample selection, placed in eight different groups and the different groups of households placed one after another in a specified order to ensure spread of the sample over the different groups. The grouping was done on considerations of means of livelihood (self-employed / regular wage or salary earning / casual labour / others) and household monthly per capita consumer expenditure.

2.9 Sample size : The survey covered, in all, 115354 households spread over 11601 sample villages/blocks. The number of sample villages and blocks allotted and surveyed, and the number of sample households and persons surveyed, are given for different state/u.t.'s and all-India in Table T0, separately for rural and urban sectors.

2.10 Estimation Procedure

2.10.1 Estimation of aggregates at sub-sample level : Aggregates are first estimated at sub-sample level according to the following estimation formulae, where \hat{y} denotes the estimate - based on one sub-sample - of the aggregate of a given characteristic Y for a sector of a state/u.t.

For the rural sector of a state/u.t. other than Arunachal Pradesh,

$$\hat{Y} = \sum_s \frac{1}{n_s} \sum_i \frac{P_{si} D_{si}}{P_{si}} \sum_{t=1}^2 \frac{H_{sit}}{h_{sit}} \sum_{j=1}^{h_{sit}} y_{sitj}$$

For the rural sector of Arunachal Pradesh,

$$\hat{Y} = \sum_s \frac{1}{n_s} \sum_{i=1}^{n_s} N_{si} \sum_{t=1}^2 \frac{H_{sit}}{h_{sit}} \sum_{j=1}^{h_{sit}} y_{sitj}$$

For the urban sector of a state/u.t.,

$$\hat{Y} = \sum_s \frac{N_s}{n_s} \sum_{i=1}^{n_s} D_{si} \sum_{t=1}^2 \frac{H_{sit}}{h_{sit}} \sum_{j=1}^{h_{sit}} y_{sitj}$$

where

- y : observed value of the same characteristic in a sample household
- s : stratum suffix
- i : sample village/block suffix
- t : second-stage stratum suffix

* 26 nucleus villages

- j : sample household suffix
- D : number of hamlet-groups/
sub-blocks formed in the surveyed
village/block
- H : number of households listed in the
second-stage sampling frame
- h : number of sample households
surveyed
- p : population of sample village as in
the sampling frame
- N : for the urban sector, number of
blocks in the sampling frame
- n : number of sample villages/blocks
surveyed in this sub-sample
- Psi : population of the s-th stratum as per
frame used in the selection of i-th
sample village of the stratum
- Nsi : for Arunachal Pradesh, number of
sample villages in the sampling
frame for s-th stratum which was
used in selection of i-th sample
village of the stratum
- D* : equals 1, if D = 1
equals D/2 if D > 1

2.10.2 Estimation of aggregates for the combined sample (pooling sub-samples) :

The combined sample estimate of an aggregate is obtained as the simple average of the corresponding sub-sample estimates.

2.10.3 **Estimates of ratios** : The estimate of a ratio of the form $R = Y/X$, where Y and X are the population aggregates of two characters, is obtained as

$$\hat{R} = \frac{\bar{Y}}{\bar{X}}$$

where \hat{Y} and \hat{X} are estimates of Y and X obtained according to the procedure laid down in paras 2.10.1 and 2.10.2. Examples of ratio estimates are rates and percentages.

3.1 **Household** : A group of persons normally living together and taking food from a common kitchen constitutes a household. The word "normally" means that temporary visitors are excluded but temporary stay-aways are included. Thus a son or daughter residing in a hostel for studies is excluded from the household of his/her parents, but a resident employee or resident domestic servant or paying guest (but not just a tenant in the house) is included in the employer/host's household. "Living together" is usually given more importance than "sharing food from a common kitchen" in drawing the boundaries of a household in case the two criteria are in conflict; however, in the special case of a person taking food with his family but sleeping elsewhere (say in a shop or a different house) due to space shortage, the household formed by such a person's family members is taken to include the person also. Each inmate of a mess, hotel, boarding and lodging house, hostel, etc. is considered as a single-member household except that a family living in a hotel (say) is considered as one household only; the same applies to residential staff of such establishments.

3.6 **Major states**: This refers to the following states of India: Andhra Pradesh, Assam, Bihar, Gujarat, Haryana, Karnataka, Kerala, Madhya Pradesh, Maharashtra, Orissa, Punjab, Rajasthan, Tamil Nadu, Uttar Pradesh and West Bengal.

3.7 **Household size**: The size of a household is the total number of persons in the household.

Section 3

Summary of findings

3.0.1- The survey findings are discussed, in the following order: 1. Changes in tobacco consumption practices since 1987-88. 2. Form of tobacco consumption: differences between sexes, states, and rural and urban areas. 3. Incidence of specific tobacco consumption practices (smoking, chewing of tobacco, use of snuff, and use of burnt tobacco): differences between sexes, states, rural and form of regularity, urban areas, and social groups. 4. Incidence of consumption of tobacco in any form: differences between sexes, age-groups, states, rural and urban areas, and social groups. 5. Consumption of tobacco in more than one

form: differences between sexes, states, and rural and urban areas.

3.1 Change over time

3.1.1 Statement 1 gives all-India percentages of persons reporting each of the four tobacco consumption practices by sex and its frequency (regular/casual), separately for rural and urban areas of the country, as obtained for two years 1987-88 (43rd round of NSS) and 1993-94. For comparison with the 43rd round estimates, the 50th round estimates given in Statement 1 are calculated, as in the 43rd round survey, as estimated number of those reporting the

	casually	1.6	0.8	1.8	0.6	1.7	0.7	1.6	0.3

practice as a proportion of total estimated population. This distinguishes them from the estimates shown in Statements 2 to 4 below (on which most of the discussion in Sections 3.2 to 3.8 are based), which are restricted to the population aged 10 and above, and are therefore somewhat higher than the figures in Statement 1.

3.1.2 Declining trend: Regular use of tobacco, in each of the four forms, appears to have declined for all four population groups: rural males, rural females, urban males and urban females, over the period 1987-88 to 1993-94. The decline in the proportion of persons regularly consuming tobacco in any form is sharper for females than for males. It may be noted that proportion of females chewing *zarda*, *dokta*, etc. has dropped from its 1987-88 level of 5% and 3% in rural and urban areas by as much as 1 percentage point in both sectors. Among males, prevalence of the most important form of tobacco consumption - smoking - has declined since 1987-88 by about 2 percentage points in rural areas to 21.7% in 1993-94 and by 2.4 percentage points in urban areas to 15.8% in 1993-94.

3.1.3 Statements 2R and 2U give per 1000 numbers of males and females aged 10 or more reporting specific forms of tobacco consumption (both regular and casual) in each of the 15 major states of India, in 1993-94.

3.1.4 In the Part II, Survey Results, detailed results, with estimates presented not only by sex but also for five different age-groups, are available for all states and u.t.s of India (Tables 1R and 1U).

3.2 Form of tobacco consumption

ALL-INDIA

3.2.1 Among **males** aged 10 or more, smoking

remained by far the most common form of tobacco consumption, with 293 regular smokers per 1000 of rural population and 202 per 1000 of urban population of the country. Chewing of *zarda*, *dokta*, etc., was a regular practice of 151 per 1000 of rural males and 80 per 1000 of urban males. 35 per 1000 rural males and 15 per 1000 urban males regularly used burnt tobacco powder or paste. Finally, regular snuff-users formed 7 per 1000 of rural males and 4 per 1000 of urban males.

3.2.2 Consumption of tobacco in one form or another was a regular practice of 430 per 1000 of the rural male population and of 277 per 1000 of the urban male population aged 10 or more.

3.2.3 In contrast to the consumption pattern for males, chewing of *zarda*, *dokta*, etc. was the more common form of tobacco consumption among **females** in most parts of the country. In India as a whole, 53 per 1000 of rural females (aged 10 or more) and 26 per 1000 of urban females reported the practice in 1993-94. Next in importance, at the all-India level, was use of burnt tobacco powder or paste which was reported by 33 per 1000 of rural females and 13 per 1000 of urban females. However, as will be seen below, smoking was the most common form of tobacco consumption among the female population of several states. Regular smokers formed 23 per 1000 of the "10+" female population in rural India and 7 per 1000 in urban India, while regular snuff-users among females, just as among males, formed 7 per 1000 of all-India rural population and 4 per 1000 of urban population.

3.2.4 Consumption of tobacco in some form or other was a regular practice of 109 per 1000 of rural females and 47 per 1000 of urban females aged 10 or more.

3.2.5 **Casual use:** Proportion of population reporting casual use of tobacco was in all cases a small fraction of those reporting a regular consumption. The "regulars" formed about 85-95% of all users. The proportion of regulars was noticeably lower for females than for males in case of smoking.

INTER-STATE VARIATION

3.2.6 **Males:** In Bihar, in contrast to the all-India pattern, regular chewers of zarda or dokta far outnumbered regular smokers, the ratio of the former to the latter being about 2.8 in rural areas and 2.4 in urban areas. In Maharashtra, chewing of tobacco was more common than smoking among urban males and twice as prevalent as smoking among rural males. In Orissa, too, chewing of tobacco was more common than smoking among the rural male population. In the remaining major states, smokers outnumbered chewers of tobacco among rural as well as urban males.

3.2.7 In rural Haryana use of burnt tobacco powder or paste was the second most important form of regular tobacco consumption (31 per 1000) among males, after smoking.

3.2.8 **Females:** Smoking, and not chewing of tobacco, was the most common form of tobacco consumption among the female population in some of the major states, notably Andhra Pradesh (rural: 69, and urban: 15 per 1000), Haryana (rural: 47, and urban: 10 per 1000), and Rajasthan (rural: 35, and urban: 16 per 1000). In many states such as Andhra Pradesh, Assam, Bihar, and U.P., smoking, and not use of burnt tobacco, came next in order of importance after chewing of tobacco for the female population in both rural and urban areas.

3.2.9 In Gujarat, taking of snuff was by far the most widespread form of tobacco

consumption among the female population (rural : 64 and urban : 26 per 1000). This was not observed in any other major state.

3.2.10 The findings of the survey regarding each of the four different forms of tobacco consumption will now be discussed separately.

3.3 Smoking

INTER-STATE VARIATION

3.3.1 Regular smokers formed more than 40% of the "10+" **male** population in rural areas of Haryana and West Bengal (43%), Rajasthan (42%) and Andhra Pradesh (41%). In rural areas the lowest proportions of male smokers were found in Punjab (10%), Bihar (12%) and Maharashtra (14%), among the major states.

3.3.2 In urban areas the highest incidence of smoking among **males** was reported by West Bengal and Haryana (30%) and the lowest by Bihar (8%) and Maharashtra (11%), among the major states.

3.3.3 Rural areas of Andhra Pradesh had the highest proportion (7%) of regular **female** smokers aged 10 and above, followed by Haryana (5%) and Rajasthan and U.P (11%) among the major states.

3.3.4 In urban areas the proportion of **female** smokers exceeded 1% only in Andhra Pradesh and Rajasthan (15-16%). For both rural and urban areas, the proportion of female smokers was lowest in Punjab (0.1%).

MALE-FEMALE DIFFERENCES

3.3.5 **All-India:** The incidence of regular smoking among females (23 per 1000 in rural India and 7 per 1000 in urban India) was, as usual, everywhere very low compared to that among males. The relative divergence between male and female rates was greater in urban

** NSS 50th round figures exclude persons aged 0-9.

M - male

F - female

areas, where the male rate (202 per 1000) was about 29 times as high as the female rate, compared to about 13 times in rural areas.

3.3.6 Inter-state variation: In rural Andhra Pradesh, the incidence of regular smoking among females was 69 per 1000, which means the incidence among males (413 per 1000) was only 6 times that among females. The male-female differential was also relatively low in rural areas of Bihar, (120 for males and 24 for females), and of Haryana, Rajasthan and Uttar Pradesh. Differentials between males and females were widest in Punjab and also wide in Karnataka and Tamil Nadu.

RURAL-URBAN DIFFERENCES

3.3.7 All-India: The incidence of smoking among females in rural areas (23 per 1000) was three times that in urban areas. For males the incidence in rural areas was only one and a half times that in urban areas.

3.3.8 Inter-state variation: Punjab is seen to be only major state where smoking is more an urban than a rural phenomenon, the rate of prevalence among males being 154 per 1000 in urban areas and only 96 per 1000 in rural areas. In Orissa, the urban and rural rates were found to be equal among males (225-226 per 1000). In all other major states the incidence of smoking both among males and females is higher (or, at least, not lower) in rural areas than in urban areas. Apart from Orissa, rural-urban differentials are low in Tamil Nadu (194, rural males and 190, urban males) and in Kerala and Maharashtra.

VARIATION WITH AGE

3.3.9 Part II survey results tables 1R and 1U show age-specific rates of incidence of regular smoking and of consumption of tobacco in any form for males and females in each state, u.t.

and all-India. Five age-groups are considered: 10-14, 15-24, 25-44, 45-59 and >59. For comparison of age-specific rates of incidence of (regular) consumption of tobacco in various forms between 1987-88 and 1993-94, Statement 5 may be seen. The rate decreased over the period for all the age-groups for both males and females.

Males

3.3.10 At the all-India level the incidence of smoking among males rises with each successive age-group starting from 10-14 up to the age-group 45-59, which shows the highest rate of incidence (nearly 50%), after which the proportion of smokers declines with increase in age. This pattern of variation with age is exhibited by every major state except Punjab, where the highest proportion of smokers is found in the age-group 25-44.

Females

3.3.11 In contrast to the situation prevailing for males, the all-India proportion of regular smokers among females rises with each successive age-group up to the last age-group 60+, though it shows a tendency to flatten out in the uppermost range. Although a few states such as West Bengal and Orissa do not conform to this pattern, most states do, including those with the highest proportions of female smokers (Andhra Pradesh, Haryana, Rajasthan and U.P.).

VARIATION WITH SOCIAL GROUP

3.3.12 Three social groups - Scheduled Tribes, Scheduled Castes and Other Households - were compared in this survey. The results are given in detail in the Part II survey results (Table 3R and 3U) and presented in abridged form in Statements 5(i) to 5(v). *Incidence of tobacco*

consumption in these tables is measured as percentage to total population (not only those aged 10 or more), and the estimates are as a result somewhat lower than those shown in the other detailed tables and statements. However, they are adequate for the purpose of identifying differences in incidence of tobacco consumption practices among the three social groups.

3.3.13 Statement 5(i) shows that in both rural and urban areas, smoking was more prevalent among the Scheduled Castes and Tribes than among the non-SC/ST population. In urban areas the percentage of regular male smokers among ST and SC were nearly equal. In rural areas the percentage was higher among ST than among SC but the differential between ST and SC was less than that between the SC/ST and the non-SC/ST population. For females, in both rural and urban areas, the incidence of regular smoking was markedly higher among STs than among SCs, and again markedly higher among SCs than among non-SC/STs. It may be noted that many states did not conform to the all-India pattern. For instance, in rural Madhya Pradesh and Uttar Pradesh, smoking was more widespread among the non-SC/ST population than among STs. The incidence of regular smoking among SC males did, however, exceed that among non-SC/ST males in every major state.

3.4 Chewing of tobacco (*zarda, dokta, etc.*)

INTER-STATE VARIATION

3.4.1 **Males:** Bihar (34%) had the highest proportion of rural males aged 10+ reporting tobacco-chewing, followed by Maharashtra, Orissa and M.P. (25-27%) and U.P. (19%). The proportion was 5% or less in 7 major states. The all-India average was 15%.

3.4.2 In urban areas, the all-India proportion of male tobacco-chewers was 8%. Bihar (20%) and Orissa (19%) had the highest rates of incidence among the major states. The rate was around 11-12% in 5 major states M.P. U.P., West Bengal, Maharashtra and Assam and less than 4% in 6 major states.

3.4.3 **Females:** By far the highest proportion of females chewing tobacco was found in Orissa (rural, 22%, and urban, 12%). Rural Maharashtra had 10% females chewing tobacco, while rural areas of West Bengal and M.P. had about 7%, and rural areas of Tamil Nadu, Kerala, Karnataka, U.P. and Assam, and urban West Bengal and Maharashtra, had around 4-5%. The all-India proportion was 5% for rural areas and 2.6% for urban areas.

MALE-FEMALE DIFFERENCES

3.4.4 At the all-India level chewing of tobacco was about three times more prevalent among males than among females in both rural and urban areas. But important regional variations were present. The incidence among females was slightly higher than that among males in Tamil Nadu and about one and a half times that among males in Kerala. In all other major states the habit was more common among males than females. Nevertheless, the male-female differential was relatively low in Orissa and in rural West Bengal. However, in Bihar - the state with the highest incidence among males - chewing of tobacco remained largely a male preserve, with the rate of incidence among females less than one-tenth that among males.

RURAL-URBAN DIFFERENCES

3.4.5 The all-India proportion of those chewing *zarda, dokta, etc.* in rural areas was

roughly double that in urban areas for both males (151 per 1000, rural, and 80 per 1000, urban) and females (53 per 1000, rural, and 26 per 1000, urban).

3.4.6 However, chewing of tobacco was more widespread in urban than in rural areas in a number of states, e.g. West Bengal (males), Rajasthan, Gujarat (males), Assam (males), and Haryana.

VARIATION WITH SOCIAL GROUP

3.4.7 **Males:** At the all-India level the percentage chewing tobacco regularly (Statement 5(iii)) was 16% for ST, 12% for SC and 10% for Others in rural areas, and 9-10% for ST, 8% for SC and 6% for Others in urban areas. Note that these percentages relate to population of all ages and the figures for "all" are therefore lower than the percentages shown in Statements 2-4.

3.4.8 **Females:** the proportion chewing tobacco was 8% for ST, 4% for SC and 3% for others in rural areas, and between 3 & 4% for ST and SC and 2% for Others in urban areas.

3.4.9 Thus, the percentages of persons, male and female, regularly chewing tobacco were highest among the ST population, and this was more noticeably so in rural areas.

3.5 Use of snuff

INTER-STATE VARIATION

3.5.1 The all-India proportion of regular snuff-users was 7 per 1000 in rural areas and 4 per 1000 in urban areas. However, the habit was even less prevalent than these figures suggest in all but a few states, of which Orissa and Gujarat are the unusually important ones. In rural Orissa, regular snuff-users constituted 77 per 1000 of the male population and 35 per

1000 of the female population. In Gujarat, the rate of incidence was 64 per 1000 for rural females and 26 per 1000 for urban females, but only 3-5 per 1000 for males; in other words, the habit was largely confined to the female population of the state. The proportion of snuff takers was around 1% among males in Tamil Nadu, rural West Bengal and urban Orissa, and females in rural Maharashtra and Haryana, and slightly under 1% in M.P. and among males of Assam. In all other major states the proportion was less than 0.5%.

MALE-FEMALE DIFFERENCES

3.5.2 As mentioned above, snuff-taking is seen to be largely a female habit in Gujarat. The same appears to be true for Rajasthan and rural Haryana. The habit is more common among females in rural Maharashtra, too. In most other major states, the habit appears to be more common among males.

RURAL-URBAN DIFFERENCES

3.5.3 Apart from West Bengal, where the snuff-taking habit clearly appears to be more widespread in urban areas than in rural, and perhaps Karnataka and Andhra Pradesh as well, other states showed greater rates of incidence in rural areas than urban.

VARIATION WITH SOCIAL GROUP

3.5.4 Statement 5(iii) shows that in rural areas the ST population had higher proportions of persons, male and female, taking snuff than the SC and non-SC/ST populations, and also that incidence of snuff-taking was markedly higher among ST females than among ST males. In urban areas, snuff-taking was more prevalent among females than among males for both ST and SC populations, and while incidence of snuff-taking among females was

higher for SC/ST than "Others", the incidence among males was higher for "Others".

3.6 Use of burnt tobacco powder or paste

INTER-STATE AND MALE-FEMALE DIFFERENCES

3.6.1 The states where the use of burnt tobacco powder or paste was most widespread were Orissa and Maharashtra. In both these states the habit was more common among females than males. In Orissa nearly 20% of rural females and 11% of urban females had the habit; also 15% of rural males and 11% of urban males. In rural Maharashtra the incidence was 14% among females and 12% among males. In urban Maharashtra it was much less: 4% among females and 3% among males.

3.6.2 In Bihar, on the other hand, use of burnt tobacco was largely confined to the male population (6% in both rural and urban areas). At the all-India level the proportions were more or less the same for males and females (3.3-3.5% for rural areas and 1.3-1.5% for urban areas). Apart from the three states mentioned above, the only state where the incidence was higher than the average for the country as a whole was Madhya Pradesh. In rural Tamil Nadu, the incidence of the habit was around 3.5%, the same as for India as a whole. In all other states, the incidence was below the all-India average.

3.6.3 In Andhra Pradesh, Maharashtra, and West Bengal, use of burnt tobacco was more common among females than males, just as in case of Orissa and Maharashtra.

RURAL-URBAN DIFFERENCES

3.6.4 The use of burnt tobacco powder or paste

was more widespread in rural areas of the country than in urban areas. This was observed in all major states.

VARIATION WITH SOCIAL GROUP

3.6.5 Prevalence of use of burnt tobacco in rural areas was highest among the ST population, and slightly higher among SCs than Others (Statement 5(iv)). In urban areas, the differences between ST and the other two groups was even more noticeable.

3.7 Consumption of tobacco in any form

INTER-STATE VARIATION

3.7.1 **Males:** For India as a whole, 43% of rural males aged 10 or more reported regular consumption of tobacco in some form or other. For 11 of the major states, the percentage ranged between 42% and 53%. The two states with the highest percentage - 53% - were Orissa and Madhya Pradesh, both of which had very high incidence of chewing of *zarda* or *dokta*. Although the latter feature was also present in Bihar and Maharashtra, the percentage of rural males regularly consuming tobacco in these two states was only 44-45% because of the low proportion of smokers there. Punjab had by far the lowest incidence of tobacco consumption habits among rural males (12%); next was Tamil Nadu with 27%; and then Kerala (31%) and Karnataka (34%).

3.7.2 In urban areas tobacco consumption among males was dominated by the smoking habit. Inter-state variation was much less, with all states except Punjab (17%) reporting proportions of male tobacco users between 22% and 41%, the all-India average being 28%. West Bengal, which had the highest proportion of urban male smokers, reported the highest rate

among the major states, followed by Assam and Orissa (38%). If those consuming tobacco casually were also considered, the rate for Assam would equal that of West Bengal.

3.7.3 Females: It was seen in Section 3.2 that proportion of female smokers was only less than 2% in rural areas of most states and only less than 1% in urban areas. On the other hand, chewing of *zarda*, *dokta*, etc. was more prevalent among women in many states, particularly in rural areas, and use of burnt tobacco was somewhat popular among women in three or four major states. It is these habits which are reflected in the proportions of females "consuming tobacco in any form". Considering rural areas, Orissa, which was seen to have 22% females chewing tobacco regularly and 20% using burnt tobacco powder or paste, is seen to have 42% females consuming tobacco in some form or other. This is much higher than the second highest proportion (24%), reported by Maharashtra. Next come six states with proportion of rural female tobacco users between 8 and 12%: Andhra Pradesh, with a high proportion of rural female smokers, M.P., Tamil Nadu and Karnataka, where both *zarda/dokta* and burnt tobacco are important, West Bengal (based mainly on chewing of tobacco), and Gujarat (based mainly on snuff). The all-India proportion of rural females regularly consuming tobacco in one form or another was 11%.

3.7.4 In urban areas also, Orissa had by far the largest proportion of regular female users of tobacco (22%). In Maharashtra, M.P. and West Bengal, the incidence of tobacco consumption among urban females was 6-8%. Both chewing of tobacco and consumption of burnt tobacco contributed significantly to these

proportions for Orissa and Maharashtra, while chewing predominated in M.P. and West Bengal. The all-India proportion of urban females with regular tobacco consumption habits was a little under 5%.

MALE-FEMALE AND RURAL-URBAN DIFFERENCES

3.7.5 These are better understood at the level of specific habits (such as smoking, snuff-taking etc.); the findings have been discussed in Sections 3.3 to 3.6.

VARIATION WITH AGE

3.7.6 For both rural urban areas, variation of tobacco consumption with age follows the same pattern, one for males and another for females, as was observed for smoking. Proportion of **males** regularly consuming tobacco increases with age up to a point, being highest for the age-group 45-59, and then declines. The proportion of males consuming tobacco in some form in the age-group 45-59 is 61% in rural areas and 51% in urban areas. The rural-urban differences are more striking in the age-group 15-24: 19% regular users among rural males compared to only 9% in urban areas.

3.7.7 For **females**, on the other hand, incidence of tobacco consumption increases with age up to the highest age-group (60+) considered here. The proportion of regular tobacco users among females in the age-group 60+ is 21% in rural areas and 13% in urban areas. The incidence of tobacco consumption among females in the age-group 15-24 in rural areas is nearly four times than that in urban areas.

VARIATION WITH SOCIAL GROUP

3.7.8 Among the three social groups considered here, the highest incidence of

tobacco consumption habits is exhibited (Statement 5(v)) by Scheduled Tribes, followed by Scheduled Castes, and then the non-SC/ST population. Among males the SC-ST differentials are less, particularly in urban areas. The preponderance of tobacco consumption habits among STs relative to the population as a whole is most striking among females, both in rural and urban areas.

3.8 Consumption of tobacco in more than one form

3.8.1 This is much less common in India than consumption of tobacco in one exclusive form. In Statements 4R and 4U both regular and casual habits are considered. The first four columns of figures in these statements give proportions of persons with the habit of consuming tobacco in one exclusive form. Combinations are considered in the remaining columns. Detailed results, with estimates presented not only by sex but also for different age-groups, are available for all states and u.t.s in Part II survey results (Tables 2R and 2U).

3.8.2 Out of a total of 451 rural males per 1000 in the country consuming tobacco in one form or another, only 73 consumed tobacco in more than one form, out of which the combination of smoking and chewing of tobacco was most common (55 per 1000). In urban areas 30 out of 296 male users of tobacco per 1000 consumed it in more than one form, 25 of these being smokers as well as chewers of tobacco.

Among females only 8 per 1000 in rural areas and 3 per 1000 in urban areas of the country consumed tobacco in more than one form.

3.8.3 In rural areas the combination of smoking and chewing of tobacco (SM & CH) was found among 60 or more males per 1000 (6% or more) in a number of states: Assam, U.P., Orissa, Bihar and West Bengal. In urban areas of these states 30 or more males per 1000 (3% or more) had the same habits. In rural Bihar and Orissa the combination of smoking and chewing of tobacco was more common than smoking alone.

3.8.4 The combination of chewing *zarda/dokta* and use of burnt tobacco (CH & BT) was seen in 6% of rural males in Maharashtra and about 5% of rural and urban males in Orissa. Among females, 3% in rural Orissa and over 1.5% in rural Maharashtra had this combination of habits.

3.8.5 The combination of smoking and use of burnt tobacco (SM & BT) had a following of 6% among males of rural and urban Orissa and about 1-2% in urban Bihar and rural areas of Haryana, Bihar, Assam and Maharashtra.

3.8.6 Other combinations were not notable except in rural areas of Orissa, where 2% combined smoking with snuff-taking, and another 2% combined snuff-taking with the use of burnt tobacco.

STATEMENT 5R(i): NUMBER OF PERSONS REPORTING HABIT OF SMOKING PER 1000 PERSONS BY HABIT OF CONSUMPTION AND HOUSEHOLD GROUP

विषय-सूची

	पृष्ठ संख्या
1. सामाजार्थिक समूहों के बीच उपभोग स्तर में अन्तर रा.प्र.सर्वे. 50वाँ दौर (जुलाई 93-जून 94)	हि. - 1
2. भारत में वस्तु रूप में वेतन, उपहारों का आदान प्रदान एवं बीमा पर किये गये क्रय रा.प्र.सर्वे. 50वाँ दौर (जुलाई 93-जून 94)	हि. - 10
3. भारत में खाद्य अंतर्ग्रहण की प्रतिवेदित पर्याप्तता रा.प्र.सर्वे. 50वाँ दौर (जुलाई 93-जून 94)	हि. - 20
4. भारत में तम्बाकू का उपभोग रा.प्र.सर्वे. 50वाँ दौर (जुलाई 93-जून 94)	हि. - 26

सामाजार्थिक समूहों के बीच उपभोग स्तर में अन्तर रा.प्र.सर्वे. 50वाँ दौर (जु.1993-जू.94)

प्रस्तावना

1.1.1 उपभोक्ता व्यय संबंधी पाँचवाँ पंचवार्षिक रा.प्र.सर्वे. के 50 वें दौर के एक भाग के रूप में 1993-94 में प्रारंभ किया गया था। प्रयुक्त पारिवारिक उपभोग व्यय अनुसूची 6951 गाँवों और 4650 शहरी खंडों से संबंधित 115354 परिवारों के संबंध में भरी गई थी।

1.1.2 सर्वेक्षण में पिछले 30 दिनों के दौरान प्रत्येक प्रतिदर्श परिवार के लिए घरेलू वृत्तांत संबंधी कुल पारिवारिक व्यय का पता लगाने तथा इसके अलावा पारिवारिक आय, पारिवारिक सामाजिक समूह (अनुसूचित जाति/अनुसूचित जनजाति/अन्य) बृहद व्यावसायिक प्रकार (कृषि में, स्व-नियोजित, नियमित मजदूरी/वेतन अर्जन आदि) के परिवारों तथा ग्रामीण परिवारों हेतु पारिवारिक स्वामित्व वाली भूमि के क्षेत्र सहित कुछ पारिवारिक व्यौरे दर्ज किए गए।

1.1.3 यह सूचना भारत के भिन्न-भिन्न राज्यों तथा संघ शासित क्षेत्रों में विशेष प्रकार के परिवारों से संबंधित व्यक्तियों हेतु पृथक-पृथक मासिक प्रति व्यक्ति व्यय के भिन्न-भिन्न वर्गों में ग्रामीण और शहरी जनसंख्या का वितरण तैयार करने में प्रयुक्त की गई थी। ये आँकड़े मौजूदा रिपोर्ट के आधार पर तैयार किए गए हैं।

1.1.4 अतः इस नोट से विभिन्न सामाजार्थिक विशेषताओं द्वारा सीमा निर्देशित जनसंख्या के विभिन्न वर्गों हेतु (एक आयाम औसत के रूप में विचार न करके अपितु विभिन्न व्यय वर्गों में वितरण से प्रति व्यक्ति व्यय की तुलना करने में समर्थ बनाती है।

1.1.5 इसी विषय संबंधी आँकड़े पीछे 1987-88 हेतु इस अवधि के दौरान आयोजित चौथे उपभोक्ता व्यय सर्वेक्षण के पंच वार्षिक अंकमाला में आयोजन के आधार पर प्रस्तुत किए गए थे।

निष्कर्षों का सार

1.2 इस नोट में पारिवारिक व्यवसाय "प्रकार", परिवार सामाजिक समूह तथा स्वामित्व वाली भूमि के आकार के अनुसार स्तर में भिन्नता तथा उपभोक्ता व्यय के बारे में चर्चा की गई है। इस उद्देश्य हेतु मासिक प्रति व्यक्ति उपभोग व्यय स्तर द्वारा प्रत्येक राज्य तथा संघ शासित क्षेत्र के प्रत्येक क्षेत्र हेतु महत्वपूर्ण व्यावसायिक प्रकारों में लगे परिवारों हेतु पृथक-पृथक (भाग-11, सारणी 1 आर और 1 यू) अनु. जाति तथा अनु. जनजाति के परिवारों हेतु तथा ग्रामीण क्षेत्रों हेतु पृथक-पृथक (भाग-11, सारणी 2 आर और 2 यू), "भूमि स्वामित्व" 6 विभिन्न आकार वर्गों में परिवारों हेतु पृथक-पृथक (भाग-11, सारणी 4 आर) तथा शहरी क्षेत्र में प्रत्येक समूह प्रकार के संयोजन हेतु (भाग-11 सारणी 4 यू) पृथक-पृथक तैयार कर वितरण दिया गया है।

1.3 मासिक प्रति व्यक्ति व्यय तथा सामाजिक समूह: एक राज्य से दूसरे राज्य पर दृष्टि

1.3.1 कुछ राज्यों को छोड़कर, प्रत्येक राज्य में अनु. जाति तथा अनु. जनजाति समूहों की मासिक प्रति व्यक्ति व्यय की स्थिति राज्य की सामान्य जनसंख्या की तुलना में संगत रूप से निर्धनतर थी जैसा कि निम्नतर मासिक प्रति व्यक्ति व्यय श्रृंखलाओं में आने वाले व्यक्तियों के समानुपात द्वारा सिद्ध है। यह राज्य के ग्रामीण और शहरी दोनों क्षेत्रों, जहाँ इन सामाजिक समूहों से संबंधित व्यक्ति काफी संख्या में मौजूद थे, में भी सच था।

1.3.2 अनुसूचित जनजाति की बड़ी संख्या वाले राज्यों में, (सामान्य जनसंख्या के अपेक्षाकृत) उड़ीसा और मध्य प्रदेश में अनु. जनजाति समूह खासतौर पर दबी हुई थी। महाराष्ट्र, बिहार, गुजरात, राजस्थान और मध्य प्रदेश में निम्नतम मासिक प्रति व्यक्ति व्यय कम में अनु. जनजाति की जनसंख्या का कम संगत रूप से वही था जो अनु. जाति का था तथा सामान्य जनसंख्या की तुलना में उच्च थी। पश्चिम बंगाल में निर्धनता और सामाजिक समूह के मध्य संबंध काफी कम पाए गए। उड़ीसा में भी अनु.

जाति समूह के लोगों में निर्धनता कमोबेश उतनी ही थी जितनी सामान्य जनसंख्या में जबकि असम में अनु. जाति समूह में निम्न मासिक प्रति व्यक्ति व्यय श्रृंखला में राज्य की सामान्य जनसंख्या की तुलना में व्यक्तियों का वास्तविक प्रतिशत थोड़ा था।

मासिक प्रति व्यक्ति व्यय तथा पारिवारिक व्यवसाय प्रकार: राष्ट्रीय पैटर्न

ग्रामीण परिवार प्रकार

1.4 परिवार समूह तथ्य की तुलना में मासिक प्रति व्यक्ति का परिवार के प्रकार से ग्रामीण वितरण का प्रभाव राज्यों में काफी एकरूप है: सभी राज्यों ने एक इसी प्रकार का "राष्ट्रीय" पैटर्न दर्शाया है। इसे 190 रुपये से कम मासिक प्रति व्यक्ति व्यय वाली ग्रामीण जनसंख्या का प्रतिशत दर्शाते हुए जो मोटे तौर पर स्तर से कम है जो भारतीय जीवन का ग्रामीण जनसंख्या का 30 प्रतिशत है - 15 प्रमुख राज्यों में प्रत्येक में महत्वपूर्ण परिवार प्रकारों हेतु सारणी टी 1 स्पष्ट करती है। सारणी ग्रामीण क्षेत्रों में परिवार प्रकार तथा मासिक प्रति व्यक्ति व्यय के मध्य कुछ मूल विशेषताओं को स्पष्ट करती है।

1.4.1 व्यावहारिक तौर पर प्रत्येक प्रमुख राज्य में एक विशेष मासिक प्रति व्यक्ति व्यय स्तर से नीचे की जनसंख्या का समानुपात औसत से भी अधिक है (सभी प्रकार "श्रमिक" परिवारों तथा "स्व-नियोजित" हेतु औसत से भी कम तथा "अन्य परिवार" (जिसमें नियमित वेतन अर्जित करने शामिल हैं)।

1.4.2 परिवार प्रकार में निर्धनों का समानुपात असम को छोड़कर (जहाँ यह "अन्य श्रमिक" परिवारों में उच्चतम है) सभी राज्यों में कृषि श्रमिक परिवारों में उच्चतम है। हरियाणा, जहाँ मासिक प्रति व्यक्ति व्यय के संदर्भ में अन्य सभी प्रकार के परिवार औसत भारतीय ग्रामीण की तुलना में काफी बेहतर हालत में, कृषि श्रमिक वर्ग की स्थिति उतनी ही खराब है, जितनी की देश में अन्यत्र कृषि श्रमिक की।

शहरी परिवार प्रकार

1.5 शहरी क्षेत्रों में स्व-नियोजित परिवार शहरी भारत की जनसंख्या 37 प्रतिशत तथा नियमित मजदूरी/वेतन अर्जित करने वाले लगभग 43 प्रतिशत तथा अन्य 20 प्रतिशत थे।

1.6 समस्त भारत पैटर्न तथा ग्रामीण क्षेत्र के रूप में सारणी टी 2 मासिक प्रति व्यक्ति व्यय भी दर्शाते हुए तीन महत्वपूर्ण परिवार के मासिक प्रति व्यक्ति व्यय में अंतर पर प्रकाश डालती है जो सभी प्रमुख राज्यों में दिखाई देता है।

1.6.1 नैमित्तिक मजदूर परिवारों के मासिक प्रति व्यक्ति व्यय स्तर स्व-नियोजित या नियमित मजदूरी/वेतन अर्जित करने वाले परिवारों से काफी कम था। हालाँकि शहरी भारत की संपूर्ण जनसंख्या का केवल 28 प्रतिशत 265 रुपये मासिक प्रति व्यक्ति व्यय के स्तर से कम था, नैमित्तिक मजदूर परिवारों

से अधिक केरल, पंजाब, हरियाणा और गुजरात को छोड़कर जहाँ यह 31 और 45 के मध्य तथा 60 प्रतिशत से अधिक था प्रमुख राज्यों में इस स्तर से नीचे था, बिहार, उत्तर प्रदेश, उड़ीसा तथा मध्य प्रदेश को शामिल करके 7 राज्यों में इस स्तर से कम था।

1.6.2 स्व-नियोजित परिवारों की स्थिति लगभग सभी प्रमुख राज्यों में, सभी परिवारों हेतु औसत से कुछ नीचे थी, इसका एक नोट करने लायक अपवाद गुजरात था। जहाँ उनकी मासिक प्रति व्यक्ति व्यय विशिष्ट रूप से औसत से ऊपर था।

1.6.3 अन्य प्रकार के परिवारों की तुलना में जो सभी प्रमुख राज्यों में एक रूप थे, मासिक प्रति व्यक्ति व्यय निम्नतम श्रृंखला में नियमित मजदूरी/ वेतन पाने वाले परिवारों के व्यक्तियों का प्रतिशत निम्नतर तथा ऊपरी श्रृंखला में यह प्रतिशत उच्चतर था।

सारणी टी 1 :परिवार प्रकार के अनुसार विभिन्न राज्यों के ग्रामीण क्षेत्रों में मासिक प्रति व्यक्ति व्यय 190 रु. वाले व्यक्तियों का प्रतिशत

परिवार प्रकार						ग्रामीण
राज्य	गैर-कृषि में स्व-नियोजित	कृषि श्रमिक	अन्य श्रमिक	कृषि में स्व-नियोजित	सभी	
आंध्र प्रदेश	20	40	33	20	28	
असम	15	36	43	11	20	
बिहार	42	67	54	33	47	
गुजरात	16	29	22	8	18	
हरियाणा	10	42	14	5	12	
कर्नाटक	30	48	27	22	31	
केरल	8	18	13	5	10	
मध्य प्रदेश	32	58	43	31	39	
महाराष्ट्र	23	56	32	23	36	
उड़ीसा	42	65	54	38	47	
पंजाब	5	12	4	1	4	
राजस्थान	15	32	32	11	16	
तमिलनाडु	19	45	21	20	30	
उत्तर प्रदेश	34	54	39	26	32	
पश्चिम बंगाल	21	43	38	11	25	
समस्त भारत	25	49	31	22	30	

1.6.4 समस्त भारत स्तर पर केवल 3 प्रतिशत नैमित्तिक श्रमिक परिवारों का मासिक प्रति व्यय 605 रु. से अधिक था, इससे केवल चार प्रमुख राज्यों गुजरात (5 प्रतिशत), केरल (6 प्रतिशत), हरियाणा (8 प्रतिशत) तथा पंजाब (14 प्रतिशत) ही इससे उच्चतर है।

1.7 जब तक भारत में कृषि अविकसित तथा पारंपरिक है, ग्रामीण भारत में भूमि अभाव तथा निर्धनता की संभावना बनी रहेगी। मासिक प्रति व्यक्ति व्यय तथा भूमि स्वामित्व के मध्य संबंध की प्रकृति भाग-11 की सारणी 3 आर में प्रकाशित की गई है जिसमें प्रत्येक राज्य/संघ शासित क्षेत्र के ग्रामीण क्षेत्रों हेतु मासिक प्रति व्यक्ति व्यय का पारिवारिक भूमि स्वामित्व वाली भूमि के आकार के 6 विभिन्न वर्गों हेतु अलग-अलग वितरण दिया गया है।

1.8 निर्धनता और भूमि के अभाव के मध्य संबंध असम, कर्नाटक, महाराष्ट्र और पश्चिम बंगाल में काफी अधिक प्रतीत होता है जहाँ निम्नतम आकार वर्ग विशेष तौर पर निर्धनताग्रस्त है। जैसे ही एक व्यक्ति भूमि स्वामित्व के निम्नतम आकार वर्ग से ऊपर उठता है 140 रु. से नीचे के विशेष मासिक प्रति व्यक्ति व्यय स्तर से नीचे की जनसंख्या का प्रतिशत केवल तृतीय आकार वर्ग (0.41-1 हेक्टेयर) से आगे बिहार तथा उत्तर प्रदेश में तथा केवल चौथे आकार वर्ग में से (1-2 हेक्टेयर) में उड़ीसा तथा मध्य प्रदेश में विशेष तौर पर घटा है। आंध्र प्रदेश तथा तमिलनाडु में लघु भूमि जोत वालों में (तथा गुजरात और राजस्थान में जहाँ निम्नतर के उदाहरण कम हैं) निर्धनता का प्रसार ज्यादा व्यापक प्रतीत नहीं होता।

समस्त भारत	108	50

। उड़ीसा और मध्य प्रदेश में बृहद जनजातियाँ हैं जो निर्धन है किन्तु भूमिहीन नहीं हैं।

1.9 मासिक प्रति व्यक्ति व्यय वितरण की ऊपरी हिस्सा भी भूमि स्वामित्व के आकार वर्ग से परिवर्तित होता है तथा यह परिवर्तन अन्य राज्यों की तुलना में कुछ राज्यों में तेजी से हुआ है। अतः सारणी टी3 दर्शाती है कि धनवानों में आने वाले व्यक्तियों का रैंकिंग भारत की ग्रामीण जनसंख्या का 5 प्रतिशत (मासिक प्रति व्यक्ति व्यय 560 रु. से अधिक गणना की गई थी या इससे अधिक) बिहार, केरल, उड़ीसा और पश्चिम बंगाल में समग्र राज्य का चार गुणा/ भूमि आधिपत्य के उच्चतम आकार वर्ग में (4 हेक्टेयर से भी अधिक वर्ग) था।

मासिक प्रति व्यक्ति व्यय में विभिन्न अंतर-सामाजिक समूह: ग्रामीण क्षेत्रों में व्यावसायिक प्रकारों में अंतर

1.10 प्रत्येक प्रकार के परिवारों के संयोजन हेतु सामाजिक समूह तथा भूमि स्वामित्व आकार वर्ग हेतु (सारणी 4 आर तथा 4 यू भाग-11) में समस्त भारत मासिक प्रति व्यक्ति व्यय वितरण की गणना की गई है। इससे यह देखने में सहायता प्राप्त होगी कि क्या कोई एक या अन्य से स्वतंत्र रूप से मासिक प्रति व्यक्ति व्यय के प्रभाव तीन तथ्यों का परस्पर प्रभाव है। ग्रामीण क्षेत्रों में सामाजिक समूह तथा पारिवारिक व्यावसायिक प्रकार के अनुसार विशेष अभिरूचि की है।

1.11 एक अभिरूचि का मुद्दा यह है कि क्या मासिक प्रति व्यक्ति व्यय में अंतर-सामाजिक समूह भिन्नताएँ विभिन्न प्रकार के परिवार या भिन्न-भिन्न हेतु यही प्रकृति है।

1.12 सारणी 4आर की प्रत्येक पंक्ति एक विशेष सामाजिक आर्थिक श्रेणी या व्यक्ति हेतु समस्त भारत (ग्रामीण) मासिक प्रति व्यक्ति वितरण दर्शाती है। चूंकि, भूमि घटक में यहाँ रूची नहीं ली जा रही केवल "सभी आकार वर्गों" वाली पंक्तियों पर ही विचार करने की आवश्यकता है। सारणी टी4 इन पंक्तियों के कुछ सैल (दो निम्नतम और उच्चतम मासिक प्रति व्यक्ति व्यय वर्गों में से प्रति हजार व्यक्तियों हेतु सैल सुनिश्चित करना तथा तीव्रतम फोकस में से कुछ महत्वपूर्ण अंतर प्रकट करना)।

1.12.1 "अन्य परिवारों" (जिसमें नियमित वेतन अर्जन करने वाले शामिल हैं) हेतु संभव को छोड़कर अनु. जनजाति के सभी प्रकार के परिवारों में अत्यधिक निर्धनता है। प्रत्येक प्रकार के परिवारों में अनु. जाति/अनु. जनजाति की तुलना में अन्य सामाजिक समूह निर्धनता से कम प्रभावित है।

1.12.2 अत्यधिक निर्धनता के उदाहरणों में सामाजिक समूहों में अंतर "श्रमिक" या "अन्य" परिवारों की तुलना में स्व-नियोजित प्रकार में अधिक पाया गया।

1.12.3 मासिक प्रति व्यक्ति व्यय वितरण के ऊपरी भाग के सामाजिक समूहों में अंतर, कृषि में स्व-नियोजित परिवारों में अत्यधिक प्रमुखता से पाया गया। इस संबंध में "गैर-कृषि" में स्व-नियोजित तथा "श्रमिक" परिवारों में यह भिन्नता अपेक्षाकृत कम पाई गई।

सारणी टी4 : प्रत्येक ग्रामीण परिवार प्रकार में विभिन्न सामाजिक समूहों में मासिक प्रति व्यक्ति व्यय के वितरण में अंतर

समस्त भारत

मासिक प्रति व्यक्ति व्यय तथा भूमि स्वामित्व के मध्य संबंधः पारिवारिक प्रकार के व्यवसाय में अंतर

1.13 कुछ सीमा तक परिवार प्रकार तथा भूमि स्वामित्व आपस में मिले हुए हैं तथा एक-दूसरे से बहुत पृथक नहीं हैं। उदाहरणार्थ, आँकड़े 3 दर्शाते हैं कि यहाँ छः भूमि आकार वर्गों में से चार पर विचार किया गया है। इनमें से कृषि में स्व-नियोजित परिवार (संख्या के रूप में) प्रभावी है, जो 0.41-1 हेक्टेयर आकार वर्ग में जनसंख्या के 50 प्रतिशत से भी अधिक है, लगभग 75 प्रतिशत जनसंख्या (1-2 हेक्टेयर) के अगले आकार वर्ग में, 3-4 हेक्टेयर आकार वर्ग में 80 प्रतिशत से अधिक तथा लगभग 90 प्रतिशत शिखर के आकार वर्ग में है। परिणामस्वरूप, इन भूमि आकार वर्गों में एक साथ लिए गए सभी प्रकार के परिवारों हेतु मासिक प्रति व्यक्ति व्यय का वितरण तदनुसारी आकार वर्गों में कृषि में नियोजित परिवारों हेतु वितरण (से लगभग समरूप शिखर के दो वर्गों हेतु तथा) को बृहद रूप से निर्धारित किया। तथापि, सारणी टी 5 की सहायता से निम्नलिखित प्रेक्षण किए गए, जिसमें (क) 140 रु. और (ख) 190 रु. (समस्त भारत ग्रामीण मासिक प्रति व्यक्ति व्यय वितरण का 10वाँ और 30वाँ प्रतिशतता) से नीचे मासिक प्रति व्यक्ति व्यय स्तर प्रत्येक प्रकार के परिवार तथा भूमि स्वामित्व आकार वर्ग से प्रति 1000 व्यक्तियों पर तथा समस्त भारत वितरण के 455 रु. 90वें प्रतिशत से अधिक के व्यक्तियों की संख्या।

1.13.1 ज्योंही हम भूमि स्वामित्व के निम्नतर आकार वर्गों से उच्चतर वर्गों में आते हैं, ऊपरी मासिक प्रति व्यक्ति व्यय अंकमाला

में व्यक्तियों की प्रतिशत (90वाँ शतमक तथा इससे अधिक) में "अन्य श्रमिक" परिवारों या "अन्य" परिवारों में कोई उछाल नहीं दर्शाया है।

1.13.2 उच्च मासिक प्रति व्यक्ति व्यय के व्यक्तियों का प्रतिशत स्व-नियोजित परिवारों में भूमि स्वामित्व में वृद्धि के साथ-साथ बढ़ना प्रारंभ हुआ है किन्तु जब यह भूमि के 1 हेक्टेयर से अधिक के आकार वर्गों में पहुँचे तथा शिखर के आकार वर्ग (4 हेक्टेयर से अधिक) केवल कृषि श्रमिक परिवारों हेतु हैं।

1.13.3 जब सभी प्रकार के परिवारों पर एक साथ विचार किया जाता है (सारणी टी 5 की नीचे की पंक्ति) 190 रु. से नीचे मासिक प्रति व्यक्ति व्यय वाले व्यक्तियों का प्रतिशत भूमि के आकार वर्ग में वृद्धि के साथ लगातार हास हुआ है। जब एकल प्रकार के परिवार पर फोकस डाला जाता है यह प्रतिशत (कृषि और गैर-कृषि) में स्व-नियोजित में प्रतिशत में हास हुआ है किन्तु "श्रमिक" परिवारों में नहीं हुआ।

1.13.4 जब सभी प्रकार के परिवारों में भूमि-स्वामित्व के आकार वर्ग में वृद्धि से ग्रामीण मासिक प्रति व्यक्ति व्यय वितरण -140 रु. के 10वें शतमक के नीचे के व्यक्तियों पर विचार किया गया है। किन्तु जब एकल प्रकार के परिवारों को पृथक से लिया जाता है, गैर-कृषि में स्व-नियोजित में केवल भूमि में वृद्धि से इस प्रतिशत में लगातार बहुत अपार्यप्त हास हुआ है। कृषि में स्व-नियोजित में उच्चतर (4 हेक्टेयर जमा) जहाँ यह 3.5 है, को छोड़कर सभी आकार वर्गों में 6-7 प्रतिशत में एकरूप है।

भारत में वस्तु रूप में वेतन, उपहारों का आदान प्रदान एवं बीमा पर किये गये क्रय रा.प्र.सर्वे. 50वाँ दौर (जु.1993-जू.94)

प्रस्तावना

1.0 रा.प्र.स.सं. ने 1993-94 के दौरान भारत में परिवार उपभोक्ता व्यय का 5वाँ पंच वार्षिक सर्वेक्षण आयोजित किया। सर्वेक्षण, देश के सम्पूर्ण भौगोलिक क्षेत्र में फैला हुआ था। 6951 गांवों और 4650 शहरी ब्लॉकों में 115354 परिवारों में साक्षात्कार आयोजित किए गए। यह नोट सर्वेक्षण पर आधारित रिपोर्टों की श्रृंखला में से एक है। इसमें वस्तु रूप में प्राप्त मजदूरी और वेतन, उपहार (गैर नकद) समारोहों पर व्यय और बीमा व्यय पर विचार किया गया है।

1.1 उपभोग करने वाले परिवार द्वारा प्रथम स्थान पर उपलब्ध माल और सेवाओं के उपभोग का अति महत्व पूर्ण तरीके : एक नकद खरीद और दो गृह उत्पादन हैं। इसके बाद नियोक्ता से वस्तु के रूप में प्राप्त माल और सेवाओं और उपहारों का स्थान है। इस दौर में परिवारों के उपभोग के रा.प्र.स. के सर्वेक्षणों के लिए अलग-अलग गत दो पहलुओं के बारे में आँकड़े भी संगृहीत किए गये थे।

1.2 50वें दौर में परिवार के सदस्यों द्वारा दिए और लिए गए

उपहारों और परिवार के सदस्यों द्वारा वस्तु अथवा परिलब्धियों के रूप में प्राप्त माल और सेवाओं के बारे में सूचना संगृहीत करने के लिए उपभोक्ता व्यय अनुसूची में पृथक ब्लॉक था। इस रिपोर्ट में उस सीमा का अध्ययन किया गया है जिस पर वस्तु और उपहारों में मजदूरी नामक दो स्रोतों पर परिवारों का उपभोग निर्भर करता है।

1.3 उपभोक्ता व्यय सर्वेक्षणों में परिवारों द्वारा किए गए समारोह एक महत्व पूर्ण समस्या जनक तत्व हैं चूंकि ये परिवार के सूचित उपभोक्ता व्यय को सामान्य स्तर से बहुत अधिक बढ़ा सकते हैं। सभी प्रकार के (विवाह, अन्तिम संस्कार, जन्म दिन तथा ऐसे ही समारोह) समारोहों की घटनाओं के बारे में आँकड़े और ऐसे समारोह आयोजित करने वाले परिवारों द्वारा किये गये औसत व्यय इस रिपोर्ट में प्रस्तुत किये गये हैं।

1.4 बीमा के प्रकार के अनुसार दिए गए बीमा प्रीमियम की राशि के आँकड़े प्रतिदर्श परिवार से संगृहीत किए गए थे। परिणामों की इस नोट में चर्चा की गई है।

वस्तु रूप में मजदूरी और उपहार

2.0.0 भारतीय परिवारों द्वारा उपभोग में लाए गए माल और सेवाएं मुख्य रूप से उनके द्वारा खरीद के जरिए प्राप्त की जाती है। ग्रामीण भारत में परिवारों का एक बड़ा भाग उनके द्वारा उपभोग में लाए गए कुछ भोजन का उत्पादन करता है।

2.0.1 अपेक्षाकृत दो और तरीके जिनके द्वारा परिवारों द्वारा माल और सेवाएं प्राप्त की जाती है, इस प्रकार है। ("परिलब्धियों" के रूप में) रूप में प्राप्त मजदूरी और वेतन (2) उपहार के रूप में। यह अध्याय 1993-94 में इन तरीकों से परिवारों द्वारा माल और सेवाओं के अधिग्रहण की सीमा से सम्बन्धित है।

3.02 ऐसी सूचना, परिवारों के सम्पूर्ण प्रतिदर्श के आधे भाग में भरी गई परिवार उपभोक्ता व्यय अनुसूची के एक विशेष ब्लॉक के माध्यम से रा.प्र.सं. के 50वें दौर में संगृहीत की गई।

2.1 वस्तु रूप में प्राप्त मजदूरी और वेतन

2.1.0 भाग-11 की सारणी 1.आर और 1.यू में 30 दिन की संदर्भ अवधि के दौरान कम से कम 15 प्रतिदर्श परिवारों द्वारा वस्तु रूप में मजदूरी और वेतन रूप में प्राप्त हुई सूचित की गई मर्दों के लिए समस्त भारत स्तर पर अनुमान दर्शाए गए हैं जिसमें (क) वस्तु रूप में मजदूरी और वेतन की मद की प्राप्ति सूचित करने वाले प्रतिदर्श परिवारों की संख्या और परिवारों का अनुमानित समानुपात और (ख) प्रत्येक प्रति व्यक्ति मासिक व्यय वर्ग के लिए 30 दिन की संदर्भ अवधि के दौरान मजदूरी और वेतन के भाग के रूप में खाद्य अथवा खाद्यतेर मद की प्राप्ति की सूचना देने वाले परिवारों द्वारा वस्तु रूप में मजदूरी और वेतन के रूप में प्राप्त मद (अथवा मद समूह) का औसत मूल्य शामिल हैं।

2.1.1 सारणियाँ दर्शाती हैं कि 1993-94 में वस्तु रूप में मजदूरी अथवा वेतन प्राप्त करने वाले भारतीय परिवारों द्वारा सामान्य रूप से प्राप्त की मद माल और सेवाएं, पकाया हुआ

खाना (तैयार) चाय और ग्रामीण क्षेत्रों में चावल, धान, गेहूँ, बीड़ी और आटा थे।

2.1.2 भारत में 7.1 प्रतिशत ग्रामीण परिवारों और 3.7 प्रतिशत शहरी परिवारों ने वस्तु रूप में कुछ मजदूरी या वेतन प्राप्त करने की सूचना दी।

2.1.3 6.6 प्रतिशत ग्रामीण परिवारों और 2.9 प्रतिशत शहरी परिवारों ने खाद्यों के रूप में कुछ मजदूरी या वेतन की प्राप्ति की सूचना दी।

2.1.4 वस्तु रूप में कुछ मजदूरी या वेतन की प्राप्ति की सूचना देने वाले परिवारों में से ऐसी प्राप्तियों का औसत मूल्य ग्रामीण क्षेत्रों में 180 रु. और शहरी क्षेत्रों में 209 रु. था। यह भी देखा जा सकता है कि इस सम्बन्ध में ग्रामीण शहरी अन्तर प्रतिव्यक्ति मासिक व्यय (ग्रामीण 281 रु. शहरी 458 रु.) के बारे में ग्रामीण शहरी अन्तर से कम है।

2.1.5 प्राप्त करने वाले प्रति परिवार की वस्तु रूप में मजदूरी की औसत प्राप्ति में खाद्यों का भाग 91 प्रतिशत ग्रामीण क्षेत्रों में (180 रु. में से 164 रु.) और केवल 61 प्रतिशत (209 रु. में से 128 रु.) शहरी क्षेत्रों में था।

2.1.6 ग्रामीण क्षेत्रों में, वस्तु रूप में मजदूरी और वेतन की 100 रु. की औसत प्राप्ति खाद्यान्नो के रूप में थी।

2.1.7 वस्तु रूप में मजदूरी अथवा परिलब्धियाँ प्राप्त करने वाले प्रति खाद्यतेर माल और सेवाओं का औसत मूल्य मोटे तौर पर दर्शाता है कि प्रतिव्यक्ति मासिक व्यय में वृद्धि के साथ साथ वृद्धि हुई है। खाद्य प्राप्तियों के मूल्य का प्रतिव्यक्ति मासिक व्यय में भिन्नता और सभी (खाद्य एवं खाद्यतेर) प्राप्तियों का मूल्य इतना स्पष्ट नहीं था। विवरण। परिवारों द्वारा वस्तु रूप में मजदूरी और वेतन की प्राप्ति करने वाले परिवारों द्वारा प्राप्त

उपभोग मदों के कुछ महत्व पूर्ण समूहों का औसत मूल्य, ग्रामीण और शहरी भारत के लिए अलग-अलग परिवारों की संख्या और अनुमानित समानुपात दर्शाता है। औसत की गणना वस्तु रूप में मजदूरी या वेतन प्राप्त करने वाले प्रति परिवार किसी न किसी खाद्य अथवा खाद्यतेर मद की प्राप्ति सूचित करने वाले परिवारों के हिसाब से की जाती है।

2.2 उपहार दिए गए और प्राप्त किए गए

2.2.0 उपहारों के मूल्य के बारे में आँकड़े उपहारों को देने और लेने वाले दोनों परिवारों के प्रत्येक प्रतिदर्श से साक्षात्कार करके संगृहीत किए गए। "दाता" और "प्राप्तकर्ता" द्वारा सूचित किए गए उपहारों का प्रतिव्यक्ति मूल्य से प्राप्त अखिल भारत अनुमान परिशिष्ट में क्रमशः सारणी-2 (आर और यू) तथा सारणी-3 (आर और यू) में परिवारों के प्रतिव्यक्ति मासिक व्यय के लिए अलग-अलग दर्शाए गए हैं। केवल उन्हीं मदों को दर्शाया गया जिनकी सूचना कम से कम 15 प्रतिदर्श परिवारों द्वारा दी गई थी।

1. 69206 ग्रामीण परिवारों और 46148 शहरी परिवारों के कुल प्रतिदर्श आकार में से संदर्भ अवधि 30 दिन
2. बिस्कुट और कनफैक्शनरी, मिठाइयां, केक/पेस्ट्री, आचार, सॉस, जैम/जैली को छोड़कर

2.2.1 30 दिनों की अवधि के दौरान देने वालों और प्राप्त करने वालों के अनुसार भारतीय परिवारों द्वारा आदान-प्रदान किए गए प्रति व्यक्ति उपहारों का कुल मूल्य क्रमशः विवरण 2 और 3 में दिया गया है। इसके साथ-साथ खाद्य और खाद्यतेर संघटकों में इस मूल्य को ब्योरा, 5 महत्वपूर्ण समूहों, खाद्यान्न, मादक पेय पदार्थ और संबंधित खाद्य, वस्त्र, जूते और टिकाऊ माल का मूल्य और इन रूपों में उपहारों की सूचना देने वाले परिवारों की संख्या और समानुपात भी दर्शाते हैं।

2.2.2 ग्रामीण क्षेत्रों में प्रति व्यक्ति उपहारों का कुल मासिक मूल्य देने वालों के अनुसार 2.42 रु. और लेने वालों के अनुसार 1.60 रु. है जब कि औसत ग्रामीण प्रतिव्यक्ति मासिक

भारतीय परिवारों द्वारा सामान्यतः वस्तु रूप में मजदूरी के रूप में प्राप्ति माल और सेवाएं 1993-94

व्यय 281 रु. था। शहरी क्षेत्रों में, 458 रु. के औसत शहरी प्रति व्यक्ति मासिक व्यय के मुकाबले देने वालों के अनुसार प्रति व्यक्ति उपहारों का औसत मूल्य 1.90 रु. और लेने वालों के अनुसार 2.34 रु. है। (रा.प्र.स. की रिपोर्ट सं. 402 के अनुसार) इस प्रकार उपहार पर प्रति व्यक्ति मासिक व्यय की तुलना में व्यय का समानुपात बहुत कम है, यह समानुपात शहरी क्षेत्रों की तुलना में ग्रामीण क्षेत्रों में अधिक है।

2.2.3 मजेदार बात यह है कि गत माह उपहार प्राप्त करने की सूचना देने वाले परिवारों का प्रतिशत (5.1 प्रतिशत ग्रामीण 4.1 प्रतिशत शहरी) गत माह उपहार देने वाले परिवारों (ग्रामीण: 2.9 प्रतिशत शहरी: 2.4 प्रतिशत) की अपेक्षा काफी अधिक है। देने वालों और लेने वालों के अनुसार परिवारों का ग्रामीण प्रतिशत शहरी की अपेक्षा अधिक है। उपर्युक्त सारणी दर्शाती है

कि सामान्य रूप से उपहारों को प्राप्त करने वालों की अपेक्षा देने वाले अधिक हैं जो प्राप्त करने वालों की संपत्ति का भाग (वस्त्र बर्तन आदि) बन जाता है और उपहारों को देने वालों की अपेक्षा प्राप्तकर्ता अधिक हैं जो उपहारों का उपभोग करता है (खाद्य, बीड़ी, पान)। गैर प्रतिचयन त्रुटियां यहाँ सम्भवतया बहुत है : त्रुटियों की पुनरावृत्ति किसी मद विशेष की प्राप्ति की किसी अजनबी को सूचना देने में अनिच्छा जैसे टिकाऊ माल और सूचना दाताओं को मामूली घटनाओं जैसे जहाँ तक संभव हो, साक्षात्कार को छोटा रखने के लिए "बीड़ी" देना को जान बूझकर दबाना। यह नोट करें कि औसतन एक दाता का प्राप्तकर्ता की अपेक्षा धनवान होने की संभावना है और छोटा उपहार प्राप्त करना दाता के लिए एक मामूली बात हो सकती है जबकि प्राप्तकर्ता के लिए नहीं।

12 उच्चतम	28.84	10.97	12 उच्चतम	13.62	10.18

2.2.4 देश के ग्रामीण तथा शहरी क्षेत्रों दोनों में उपहार देने वालों के अनुसार वस्त्र सभी उपहारों के मूल्य का 57-58 प्रतिशत तथा प्राप्त करने वालों के अनुसार कुल मूल्य का 47 प्रतिशत है। लगभग सभी मामलों में पांच समूह "खाद्यान" मादक पेय और संसंधित खाद्य "वस्त्र" "जूते-चप्पल" और "टिकाऊ माल" का उपहारों का कुल मूल्य 90 प्रतिशत अथवा अधिक रहा।

2.2.5 भारत में 1993-94 में अत्यधिक लोकप्रिय उपहार की वस्तु उपयुक्त सारणी में दी गई है।

2.2.6 ग्रामीण और शहरी प्रतिव्यक्ति मासिक व्यय वर्गों में दिए गए/प्राप्त किए गए उपहारों के मूल्य में विभिन्नतः (नोट

करें कि ये प्रति व्यक्ति उपभोग का अखिल भारत ग्रामीण और शहरी वितरण के "समस्य" विखंडित समूह है) नीचे सारणी में दर्शाई गई है। ग्रामीण आँकड़ों पर शहरी आँकड़ों को अपेक्षा प्रतिचयन उतार-चढ़ाव का क्रम प्रभाव पड़ता है। ग्रामीण क्षेत्रों में ऊपर के तीन प्रतिव्यक्ति मासिक व्यय वर्ग उपहारों के "निवल दाता" आंके गए हैं। नीचे के चारों वर्ग ग्रामीण और शहरी दोनों क्षेत्रों में "निवल प्राप्त कर्ता" हैं। 5वें छठे, सातवें वर्गों की स्थिति ग्रामीण और शहरी क्षेत्रों में कुछ-कुछ भिन्न है। शहरी क्षेत्रों में ये वर्ग जितना ये देते हैं उससे औसतन दो या तीन गुना अधिक प्राप्त करने वाले प्रतीत होते हैं। ग्रामीण क्षेत्रों में तदनरूपी वर्ग लगभग उतना ही देते हैं जितना वे प्राप्त कर रहे हैं।

विवरण : 30 दिन की अवधि के दौरान मजदूरी और वेतन अथवा परिलब्धियों के भाग के रूप में प्रति परिवार प्राप्त किए गए माल या सेवाओं का औसत मूल्य

समारोहों और बीमा पर व्यय

3.1 गत 30 दिनों के दौरान किए गए समारोहों की सूचना देने वाले परिवारों का समारोहों पर हुआ औसत व्यय और परिवारों का समानुपात

3.1.1 रा.प्र.स. के 50वें दौर में परिवार उपभोक्ता व्यय अनुसूची में गत 30 दिनों के दौरान परिवारों द्वारा किए गए समारोहों के बारे में एक विशेष ब्लॉक था। वस्तु रूप में उपहार और मजदूरी के बारे में ब्लॉक की तरह इस ब्लॉक को भी सभी प्रतिदर्श परिवारों के आधे में से भरा गया था।

3.1.2 समारोहों पर व्यय पांच प्रमुख शीर्षों के अंतर्गत रिकार्ड किया गया जो खाद्य, वस्त्र और जूते विविध माल और सेवाएं और उपभोक्ता किराया टिकाऊ माल और अन्य व्यय हैं। प्रत्येक राज्य और संघ शासित क्षेत्र के लिए प्रति परिवार मासिक व्यय वर्ग के अनुसार सारणीकृत विस्तृत परिणाम भाग 11 की सारणी 4 आर और 4 यू में दिया गया है। नोट करें कि ये सारणियां समारोहों की सूचना देने वाले प्रति परिवार का औसत व्यय दर्शाती है। औसत व्यय की गणना में से किसी समारोह का आयोजन न करने वाले परिवारों को शामिल नहीं किया गया है।

3.1.3 गत माह समारोहों को आयोजित करने वाले परिवारों का समानुपात ग्रामीण भारत में लगभग 9 प्रति 1000 था और शहरी भारत में 6 प्रति 1000 परिवार था।

3.1.4 ग्रामीण और शहरी क्षेत्रों में समारोहों का आयोजन करने वाले परिवारों के समानुपात में प्रति व्यक्ति मासिक व्यय स्तर के बढ़ने के साथ-साथ वृद्धि हुई।

3.1.5 परिवारों द्वारा आयोजित समारोहों पर आया औसत व्यय ग्रामीण भारत के लिए 4458 रुपये और शहरी भारत के लिए 3342 रु. है (विवरण 4 और 5)। औसत प्रति व्यक्ति मासिक व्यय वर्ग (281 रु. ग्रामीण और 458 रु. शहरी) के आँकड़ों के समक्ष, आँकड़े दर्शाते हैं कि समारोहों का औसत

ग्रामीण परिवार पर औसत शहरी परिवार की अपेक्षा अधिक वित्तीय बोझ पड़ता है।

3.1.6 ग्रामीण परिवारों के कुल व्यय का खाद्य पर तीसरा स्थान है और शहरी परिवारों का खाद्य पर लगभग 30 प्रतिशत व्यय होता है समग्र रूप से व्यय के विभिन्न संघटकों के भागों में ग्रामीण और शहरी क्षेत्रों में अधिक अन्तर नहीं है। टिकाऊ माल पर व्यय का भाग शहरी क्षेत्रों में कुछ अधिक था।

3.1.7 प्रतिचयन उतार चढ़ाव में राज्यों में समारोहों (और इसके विभिन्न संघटकों) पर औसत व्यय की विभिन्नता के पैटर्न को और प्रति व्यक्ति मासिक व्यय वर्गों में विभिन्नता के पैटर्न को धुंधला करने का रुख था। इस प्रकार विवरण 4 में आँकड़ों के आधार पर यह पता लगाना कठिन है कि समारोहों पर औसत व्यय प्रतिव्यक्ति मासिक व्यय में वृद्धि (अथवा विपरीत) के साथ बढ़ता है।

3.2 गत 365 दिनों के दौरान ऐसे व्यय को सूचना देने वाले परिवारों का बीमा प्रीमियम पर किया गया औसत मासिक व्यय और परिवारों का समानुपात।

3.2.0 सर्वेक्षण की तारीख से पूर्व एक वर्ष की अवधि के दौरान प्रतिदर्श परिवारों द्वारा बीमा प्रीमियम पर किये गये व्यय को भी 50वें दौर की उपभोक्ता व्यय अनुसूची में दर्ज किया गया। बीमा की किस्म के अनुसार औसत मासिक व्यय के अनुमानों को, 12 प्रति व्यक्ति मासिक व्यय वर्गों के लिए सभी राज्यों और संघ शासित क्षेत्रों के लिए विस्तार से, भाग-11 की सारणी 5 (आर और यू) में प्रस्तुत किया गया है। समारोहों पर हुए व्यय की तरह, बीमा प्रीमियम पर हुए औसत व्यय की गणना सूचना देने वाले प्रति परिवार के हिसाब से की जाती है।

3.2.1 बीमा की भिन्न-भिन्न किस्में जिनके बारे में आँकड़े संगृहीत किए गए, इस प्रकार हैं: जीवन बीमा परिवार के स्वामी

का व्यापक बीमा आग तथा सम्बद्ध जोखिम (केवल) बीमा, चोरी (केवल) बीमा, निजी दुर्घटना बीमा, मोटर वाहन बीमा, चिकित्सा बीमा, आवागमन बीमा और अन्य बीमा।

3.2.2 यह देखा गया है कि बीमा पर व्यय करने वाले परिवारों का प्रतिशत शहरी क्षेत्रों में (22 प्रतिशत) ग्रामीण क्षेत्रों (5.5 प्रतिशत) की अपेक्षा 4 गुना अधिक था।

3.2.3 भिन्न-भिन्न प्रकार के बीमा में सबसे प्रमुख जीवन बीमा (18 प्रतिशत शहरी परिवारों द्वारा सूचित) था। अन्य क्रिस्मों के बारे में 1 प्रतिशत से भी कम ग्रामीण परिवारों ने सूचना दी। शहरी परिवारों में 4 प्रतिशत परिवारों ने मोटर वाहन बीमा पर व्यय किया और 4 प्रतिशत परिवारों ने एक अथवा इससे अधिक किस्म के बीमा में व्यय की सूचना दी।

3.2.4 अखिल भारत स्तर पर, जीवन बीमा में ग्रामीण तथा शहरी क्षेत्रों में बीमा प्रीमियम के बारे में 85-90 प्रतिशत व्यय हुआ। जीवन बीमा का सापेक्ष महत्व पंजाब और ग्रामीण राजस्थान में न्यूनतम था।

3.2.5 मोटर वाहन बीमा विशेष रूप से पंजाब में महत्वपूर्ण था, जहाँ ग्रामीण क्षेत्रों में यह व्यय लगभग 30 प्रतिशत और शहरी क्षेत्रों में लगभग 14 प्रतिशत था।

3.2.6 समग्र रूप से बीमा पर मासिक व्यय प्रतिव्यक्ति मासिक व्यय स्तर में वृद्धि के साथ बढ़ गया, यद्यपि इस पैटर्न का प्रतिचयन के उतार-चढ़ाव द्वारा बिगाड़ दिया गया।

3.2.7 बीमा पर व्यय करने वाले परिवारों की अनुमानित संख्या में, ग्रामीण और शहरी क्षेत्रों में प्रति व्यक्ति मासिक व्यय स्तर में वृद्धि होने से तेजी से वृद्धि हुई है।

भारत में खाद्य अंतर्ग्रहण की प्रतिवेदित पर्याप्तता : रा.प्र.सर्वे. 50वाँ दौर (जु.1993-जू.94)

प्रस्तावना

1.1 पंचवार्षिक सर्वेक्षणों में प्रत्येक प्रतिदर्श परिवार में उपभोक्ता व्यय तथा रोजगार-बेरोजगारी के बारे में दो अलग-अलग अनुसूचियाँ - उपभोक्ता व्यय हेतु अनुसूची 1.0 तथा रोजगार-बेरोजगारी हेतु अनुसूची 10 भरी जाती है ताकि उपभोक्ता व्यय तथा रोजगार-बेरोजगारी पर भिन्नताओं का प्रति सारणीयन किया जा सके। तथापि, यह रिपोर्ट भारतीय परिवारों को भोजन की पर्याप्त उपलब्धता पर प्रमुख रूप से प्रकाश डालने वाली एकमात्र अनुसूची 1.0 पर आधारित है।

1.2 भारतीय परिवार के सदस्यों के द्वारा भोजन की पर्याप्तता की उपलब्धता का विवरण जैसा कि सर्वेक्षण के वर्तमान दौर में बताया गया है, को इस नोट में प्रस्तुत किया गया है।

1.3 प्रवृत्ति का अध्ययन करने की दृष्टि से, वर्तमान सर्वेक्षण के पर्याप्त खाद्य की उपलब्धता के अनुमानों की रा.प्र.सर्वे. के 38वाँ दौर, 1983 के दौरान आयोजित उपभोक्ता व्यय संबंधी तृतीय पंचवार्षिक सर्वेक्षण के अनुमानों के साथ तुलना की गई है।

1.4 संयुक्त प्रतिदर्श आँकड़ा (उप-प्रतिदर्श 1 तथा 2 दोनों) पर आधारित यह रिपोर्ट पूर्वोक्त मामलों पर सर्वेक्षण के विस्तृत परिणामों का सार प्रस्तुत करती है। इस सर्वेक्षण दौर में अपनाए गए प्रतिचयन अभिकल्प तथा आकलन प्रक्रिया आगामी अध्याय में दी गई है। अध्याय तीन संक्षेप में इस सर्वेक्षण तथा इस रिपोर्ट में प्रयुक्त जरूरी अवधारणाओं तथा परिभाषाओं को विस्तार देता है तथा सर्वेक्षण उपलब्धियों की अध्याय चार में चर्चा की गई है। विस्तृत आँकड़ा सारणियों का संग्रह प्रतिवेदन के साथ संलग्न है।

1.5 भोजन पर्याप्तता के संबंध में परिवार अवबोधन: जब संदर्भ अवधि के दौरान सूचित उपभोग से यह प्रकट ना होता हो कि परिवार के सदस्य पर्याप्त भोजन प्राप्त कर रहे हैं तब प्रश्न "क्या परिवार के सभी सदस्य एक दिन में दो वक्त का भर पेट भोजन प्राप्त करते हैं" उस उत्तरदाता के समक्ष था, जो इस कठिनाई की स्पष्ट समझ रखता है।

सर्वेक्षण निष्कर्ष

2.0 यह अध्याय पर्याप्त भोजन की उपलब्धता के अनुसार परिवारों का वितरण से संबंधित है जैसा कि 50वें दौर सर्वेक्षण से प्रकट किया गया था। प्रतिदर्श परिवारों/सूचना देने वालों से एक प्रश्न पूछा गया था कि क्या परिवारों के सदस्यों को वर्ष भर, वर्ष के केवल कुछ महीनों के दौरान रोज नहीं, खाने के लिए पर्याप्त भोजन मिलता है। यह प्रश्न उन व्यक्तियों के लिए सुसंगत नहीं है जो प्रतिवेदित खपत स्पष्टतः निर्देशित करते हैं कि उन्हें खाने के लिए पर्याप्त भोजन मिलता है। उन परिवारों से यह अतिरिक्त प्रश्न पूछा गया, जिन्होंने केवल वर्ष के कुछ महीनों में पर्याप्त भोजन की उपलब्धता सूचित की है। पंचांग महीनों संबंधी जानकारी जिसमें परिवारों के सभी सदस्यों के पास पर्याप्त भोजन नहीं होता है, ऐसे परिवारों के लिए रिकार्ड किया गया था।

2.0.1 दशक (1983 से 1993-94) में पर्याप्त भोजन की उपलब्धता पर अवलोकित प्रवृत्ति पर प्रथमतः चर्चा हुई जिसका निम्नलिखित पैराग्राफों में चालू रा.प्र.सर्वे. पंचवार्षिक दौर के परिणामों पर विस्तृत चर्चा द्वारा अनुकरण किया जाएगा।

2.1.1 रा.प्र.सर्वे. दौरों के बाद पर्याप्त भोजन की उपलब्धता में पाई गई प्रवृत्तियाँ

2.1.2 वर्ष भर पर्याप्त भोजन की उपलब्धता की सूचना देने वाले परिवारों के अनुपात में वृद्धि, दोनों ग्रामीण और शहरी क्षेत्रों में 1983 से 1993-94 तक की अवधि के लिए देखी गई है। इस अवधि के दौरान समानुपात ग्रामीण भारत के लिए 81.1 प्रतिशत से 94.5 प्रतिशत तक और शहरी भारत के लिए 93.3 प्रतिशत से 98.1 प्रतिशत तक पहुंच गया।

रा.प्र.सर्वे. 50वाँ दौर के विस्तृत परिणाम

2.2 (i) राष्ट्रीय स्तर पर प्रत्येक एमपीसीई श्रेणी के लिए

और (ii) प्रत्येक 15 प्रमुख राज्यों के लिए पर्याप्त भोजन की उपलब्धता के अनुसार परिवारों का प्रति हजार वितरण

2.2.1 विवरणी 1 और 2 में क्रमशः (i) राष्ट्रीय स्तर पर प्रत्येक एमपीसीई श्रेणी के लिए और (ii) प्रत्येक 15 प्रमुख राज्यों के लिए पर्याप्त भोजन की उपलब्धता के अनुसार परिवारों का प्रति हजार वितरण दिया गया है।

2.2.2 विवरणी 1 से यह देखा गया है कि वर्ष भर पर्याप्त खाद्य प्राप्त करने वाले परिवारों का समानुपात राष्ट्रीय स्तर पर दोनों ग्रामीण और शहरी क्षेत्रों में एमपीसीई स्तर के बढ़ने के साथ-साथ बढ़ जाता है। स्पष्टतः वर्ष के कुछ महीनों में और वर्ष भर न प्राप्त करने वाले पर्याप्त खाद्य की उपलब्धता की सूचना देने वाले परिवारों का समानुपात एमपीसीई स्तर के बढ़ने के साथ-साथ कम हो जाता है। कालम (2) से (4) तक के नीचे कोष्ठकों में दिए गए आँकड़े जिसके लिए खाद्य की पर्याप्तता का यह प्रश्न वास्तव में अन्वेषकों द्वारा पूछा गया था।

2.2.3 विवरणी 2 से यह देखा गया है कि ग्रामीण क्षेत्र में वर्ष भर पर्याप्त खाद्य प्राप्त करने वाले परिवारों का प्रतिशत पंजाब के अतिरिक्त सभी प्रमुख राज्यों में और राष्ट्रीय स्तर पर शहरी क्षेत्र से कम है। राष्ट्रीय स्तर पर, ग्रामीण क्षेत्र में लगभग 95 प्रतिशत परिवार शहरी क्षेत्र के लगभग 98 प्रतिशत के मुकाबले उड़ीसा (84 प्रतिशत) और पश्चिम बंगाल (86 प्रतिशत) राज्यों में वर्ष भर पर्याप्त भोजन प्राप्त तो करते हैं लेकिन ग्रामीण क्षेत्र में वर्ष भर 90 प्रतिशत से भी कम परिवार पर्याप्त भोजन प्राप्त करते हैं। राज्य, जहाँ परिवारों का अधिकतम प्रतिशत भोजन की इस आधारभूत जरूरत को पूरी करते हैं वे पंजाब, हरियाणा (ग्रामीण और शहरी क्षेत्र दोनों) और राजस्थान (शहरी क्षेत्र) हैं।

2.2.4 यह देखा गया है कि राष्ट्रीय स्तर पर शहरी क्षेत्र में परिवारों का 1.1 प्रतिशत के मुकाबले ग्रामीण क्षेत्र में परिवारों

का 4.2 प्रतिशत वर्ष के केवल कुछ महीनों में ही पर्याप्त भोजन प्राप्त करते हैं। ग्रामीणी क्षेत्र में उड़ीसा और पश्चिम बंगाल के राज्यों में 10 प्रतिशत से भी अधिक परिवार केवल पंचांग वर्ष के कुछ महीनों के दौरान पर्याप्त भोजन प्राप्त करते हैं।

2.2.5 वे परिवार जिनमें सभी सदस्य वर्ष भर पर्याप्त भोजन प्राप्त नहीं करते हैं। ग्रामीण भारत 0.9 प्रतिशत की तदनुरूपी आँकड़ों के मुकाबले असम और पश्चिम बंगाल प्रत्येक में 3 प्रतिशत है।

विवरण 1 : राष्ट्रीय स्तर पर प्रत्येक एमपीसीई श्रेणी के लिए प्रति दिन दो वक्त का भरपेट भोजन की उपलब्धता के अनुसार परिवारों का प्रति हजार वितरण

एमपीसीई श्रेणियाँ	वर्ष भर	एक दिन में दो वक्त का भरपेट भोजन प्राप्त करने वाले परिवारों के सदस्य				स्थापित परिवारों की संख्या (00)	प्रतिदर्श परिवारों की संख्या

भारत में तम्बाकू का उपभोग : रा.प्र.सर्वे. 50वाँ दौर (जु.1993-जू.94)

1.0 रा.प्र.सर्वे.सं. ने 1993-94 के दौरान भारत में पारिवारिक उपभोग व्यय का अपना पांचवां पंच वार्षिक सर्वेक्षण आयोजित किया। सर्वेक्षण देश के समग्र भौगोलिक क्षेत्र में किया गया था। 6951 गांवों और 4650 शहरी खंडों में 115354 परिवारों का साक्षात्कार लिया गया था। मौजूदा रिपोर्ट सर्वेक्षण पर आधारित रिपोर्टों की श्रृंखला में से एक है।

1.1 भारतीय जनसंख्या की तम्बाकू उपभोग की आदतों संबंधी आँकड़े जैसा कि तम्बाकू के उपभोग की प्रमात्रा तथा मूल्य से स्पष्ट है, भारत में प्रति व्यक्ति तम्बाकू के उपभोग की प्रमात्रा तथा मूल्य रा.प्र.सर्वे. की रिपोर्ट संख्या 404 : 'भारत में कुछ महत्वपूर्ण पण्यों का उपभोग' के जरिए पहले ही जारी की गई थी।

1.2 सर्वेक्षण अनुसूची में चार प्रकार के तम्बाकू उपभोग दर्शाए गए थे : (बीड़ी-सिगरेट) पीना, तम्बाकू चबाना (ज़र्दा, दोक्ता आदि) : नसवार सूंघना तथा जला हुआ तम्बाकू पाउडर या पेस्ट का उपभोग करना। सर्वेक्षित परिवार के प्रत्येक सदस्य से सूचना के जरिए यह पता लगाया गया था कि (लगभग परिवार के एक सदस्य के सभी मामलों में) क्या सदस्य को इन चारों प्रकारों में से किसी में भी तम्बाकू के उपभोग करने की आदत है और यदि ऐसा है तो क्या यह आदत नियमित है या कभी-कभी।

1.3 अतः इससे प्राप्त आँकड़ों के आधार पर भारत के प्रत्येक राज्य तथा संघ शासित क्षेत्रों के ग्रामीण तथा शहरी क्षेत्रों में उपभोग के चार विभिन्न प्रकारों हेतु पृथक-पृथक नियमित/कभी-कभी की आदत वाले दो लिंगों, आयु तथा सामाजिक समूह के व्यक्तियों का समानुपात तैयार किया गया था।

1.4 ऐसे आँकड़े रा.प्र.सर्वे. के 43वें दौर सर्वेक्षण हेतु वर्ष 1987-88 से संबद्ध जारी किए गए थे।

संक्षिप्त निष्कर्ष

2.0.1 सर्वेक्षण निष्कर्षों पर निम्नलिखित में विचार-विमर्श किया गया :

1. 1987-88 से तम्बाकू के उपयोग करने की आदत में बदलाव।
2. तम्बाकू उपभोग के प्रकार : लिंग, राज्यों तथा ग्रामीण और शहरी क्षेत्रों के मध्य अंतर।
3. विशेष तम्बाकू उपभोग की आदतों की घटनाएं (धूम्रपान, तम्बाकू चबाना, नसवार का उपयोग तथा बुझे तम्बाकू का उपयोग) लिंग, राज्यों, ग्रामीण तथा शहरी क्षेत्रों तथा विशेष समूहों के मध्य अंतर।
4. किसी भी रूप में तम्बाकू के उपभोग का उदाहरण : लिंग, आयु समूह, राज्य, ग्रामीण तथा शहरी क्षेत्र और सामाजिक समूह के मध्य अंतर।
5. एक से अधिक रूपों में तम्बाकू का उपभोग : लिंग, राज्यों तथा ग्रामीण और शहरी क्षेत्रों के मध्य अंतर।

2.1.1 विवरणी 1 तम्बाकू उपभोग के व्यवहार के चार प्रकारों में से प्रत्येक में सूचित व्यक्तियों का लिंग और (नियमित/कभी-कभी) इसकी आवृत्ति के अनुसार समस्त भारत प्रतिशत देश के

ग्रामीण और शहरी क्षेत्रों हेतु पृथक-पृथक दिया गया है जैसा कि दो वर्षों 1987-88 (रा.प्र.सर्वे. का 43वां दौर) तथा 1993-94 हेतु लिया गया है। 43वें दौर के अनुमानों से तुलना हेतु विवरणी 1 में दिए गए 50वें दौर के अनुमानों की, जबकि 43वें दौर सर्वेक्षण में है, जैसा कि तम्बाकू के व्यवहार सूचित करने वाले व्यक्तियों की अनुमानित संख्या हो, जैसा कि कुल अनुमानित जनसंख्या का समानुपात हो, गणना की गई। यह उन्हें जो 10 वर्ष और इससे अधिक जनसंख्या तक सीमित है तथा विवरणी 1 में दिए गए आँकड़ों से कुछ अधिक है, नीचे विवरणी 2 में दर्शाएँ अनुमानों से पृथक करता है।

2.1.2 नियमित तम्बाकू का उपयोग, उपयोग के चारों प्रकार में से प्रत्येक में तथा जनसंख्या के चार

समूहों में से प्रत्येक में तथा जनसंख्या के चार समूहों, ग्रामीण पुरुषों, ग्रामीण महिलाओं शहरी पुरुष तथा शहरी महिलाओं में वर्ष 1987-88 से 1993-94 की अवधि में हास प्रतीत होता है। किसी भी रूप में नियमित तम्बाकू के उपयोग वाले व्यक्तियों के समानुपात में पुरुषों की तुलना में महिलाओं की संख्या में तेजी से हास हुआ है। यह नोट किया जाए कि ज़र्दा और दोक्ता आदि चबाने वाली महिलाओं का समानुपात 1987-88 में ग्रामीण और शहरी क्षेत्रों में 5 प्रतिशत और 3 प्रतिशत रही जो दोनों क्षेत्रों में लगभग 1 प्रतिशत पाइंट है। पुरुषों में प्रचलित तम्बाकू उपभोग में बहुत महत्वपूर्ण प्रकार - धूम्रपान - 1987-88 से लगभग 2 प्रतिशत पाँवइंट 1993-94 में ग्रामीण क्षेत्रों में 21.7 प्रतिशत तथा शहरी क्षेत्रों में 1993-94 में 2.4 प्रतिशत पाँवइंट 15.8 प्रतिशत हुई।

विवरणी 1 : लिंग और राष्ट्रीय स्तर पर रा.प्र.सर्वे. दौरों के अनुसार विभिन्न रूपों में तम्बाकू के उपभोग वाले व्यक्तियों का प्रतिशत वितरण

2.1.3 विवरणी 2 आर और 2 यू 10 और इससे अधिक आयु के पुरुष और महिलाओं की 1993-94 में भारत के 15 प्रमुख राज्यों में से प्रत्येक में (नियमित और कभी-कभी दोनों में) तम्बाकू के विशेष रूप का उपभोग करने वाले, प्रति हजार में संख्या में दर्शाती है।

2.1.4 भाग-11 में न केवल लिंग के अनुसार अपितु पांच विभिन्न आयु समूह के लिए भी अनुमानों सहित विस्तृत परिणाम प्रस्तुत किए गए हैं, भारत के सभी राज्यों तथा संघ शासित क्षेत्रों के लिए उपलब्ध हैं (सारणियां 1 आर तथा 1 यू)।

2.2 तम्बाकू उपभोग के प्रकार

समस्त भारत

2.2.1 10 वर्ष और इससे अधिक आयु के पुरुषों में धूम्रपान तम्बाकू के उपभोग का एक बहुत अधिक सामान्य रूप रहा है। ग्रामीण जनसंख्या के प्रति हजार धूम्रपान वालों में से 293 नियमित थे तथा देश की शहरी जनसंख्या के प्रति हजार पर 202 थे। ज़र्दा, दोक्ता आदि को चबाने का ग्रामीण पुरुषों के प्रति 1000 पर 151 तथा शहरी पुरुषों का प्रति हजार पर 80 पुरुष नियमित व्यवहार करते थे। ग्रामीण पुरुषों के प्रति 1000 पर 35 तथा शहरी पुरुषों के प्रति हजार पर 15 बुझे हुए तम्बाकू पाउडर या पेस्ट का नियमित रूप से प्रयोग करते थे। अंततः,

ग्रामीण पुरुषों के प्रति हजार पर 7 तथा शहरी पुरुषों के प्रति हजार पर 4 नियमित नसवार प्रयोक्ता थे।

2.2.2 एक प्रकार से या अन्य प्रकार से तम्बाकू का उपभोग 10 वर्ष या इससे अधिक आयु की ग्रामीण पुरुष जनसंख्या के प्रति हजार पर 430 तथा शहरी पुरुष जनसंख्या के प्रति 1000 पर 270 पुरुष नियमित व्यवहार करते थे।

2.2.3 पुरुषों के तम्बाकू उपभोग के पैटर्न के विपरीत, देश के अधिकांश भागों में महिलाओं में तम्बाकू उपभोग का एक आम तरीका ज़र्दा, दोक्ता चबाना था। भारत में कुल मिलाकर (10 वर्ष या इससे अधिक आयु की) ग्रामीण महिलाओं में प्रति हजार पर 53 तथा शहरी महिलाओं के प्रति हजार पर 26 ने 1993-94 में इनके उपभोग की सूचना दी। समस्त भारत स्तर पर महत्व के हिसाब से उपभोग में दूसरा बुझा हुआ तम्बाकू या पेस्ट था जो ग्रामीण महिलाओं के प्रति हजार पर 33 तथा शहरी महिलाओं के प्रति हजार पर 13 सूचित किया गया था। तथापि, जैसा कि नीचे देखा जा सकेगा, कई राज्यों में महिला जनसंख्या में धूम्रपान एक अत्यधिक सामान्य रूप है। ग्रामीण भारत में महिला जनसंख्या '10' में प्रति हजार पर 23 तथा शहरी भारत में प्रति हजार पर 7 नियमित धूम्रपान करती हैं, जबकि महिलाओं में नियमित नसवार प्रयोक्ताओं का समस्त भारत ग्रामीण जनसंख्या 1000 पर 7 था शहरी जनसंख्या के 1000 पर 4 थी।

पश्चिम बंगाल	302	30	411	32	6	1	60	7	150934	13517
भारत	202	18	277	21	7	1	47	4	1927372	203248

2.2.4 किसी एक रूप में या अन्य रूपों में तम्बाकू का उपभोग 10 वर्ष और इससे अधिक आयु की ग्रामीण महिलाओं में 1000 पर 109 तथा शहरी महिलाओं में 10000 पर 47 नियमित उपभोग करती थी।

2.2.5 **कभी-कभी उपभोग** : तम्बाकू का कभी-कभी उपभोग सूचित करने वाली जनसंख्या का समानुपात नियमित उपभोग करने वालों का सभी मामलों में एक लघु खंड था। सभी प्रयोक्ताओं में 'नियमित' वाले लगभग 85-95 प्रतिशत थे। धूम्रपान के मामले में नियमित वालों का समानुपात पुरुषों की तुलना में महिलाओं में काबिले गौर काफी कम था।

अंतरराज्यीय भिन्नता

2.2.6 **पुरुष** : बिहार में समस्त-भारत पैटर्न के विपरीत जदा या दोक्ता के नियमित सेवन से नियमित धूम्रपान वालों की संख्या बहुत अधिक है, परवर्ती और पूर्ववर्ती का अनुपात ग्रामीण क्षेत्रों में लगभग 2.8 तथा शहरी क्षेत्रों में 2.4 है। महाराष्ट्र में शहरी पुरुषों में धूम्रपान की तुलना में तम्बाकू का सेवन बहुत आम बात है तथा ग्रामीण क्षेत्रों में धूम्रपान इससे दुगुना प्रचलित है। शेष प्रमुख राज्यों में ग्रामीण के साथ-साथ शहरी पुरुषों में भी तम्बाकू चबाने वालों से धूम्रपान वालों की संख्या बहुत अधिक है।

2.2.7 ग्रामीण हरियाणा में धूम्रपान के बाद बुझा हुआ तम्बाकू पाउडर या पेस्ट नियमित तम्बाकू उपभोग करने वालों में (1000 पर 31) द्वितीय महत्वपूर्ण रूप था।

2.2.8 **महिलाएं** : कुछ प्रमुख राज्यों में खास तौर पर आन्ध्र प्रदेश (प्रति हजार पर ग्रामीण 69 तथा शहरी 15) हरियाणा (प्रति हजार पर ग्रामीण 47 तथा शहरी 107) तथा राजस्थान (प्रति हजार पर ग्रामीण 35 तथा शहरी 16) में धूम्रपान करना तथा तम्बाकू न चबाना महिला जनसंख्या में तम्बाकू उपभोग का एक अति सामान्य रूप था। बहुत से राज्यों में जैसा कि आन्ध्र प्रदेश, असम, बिहार तथा उत्तर प्रदेश में ग्रामीण और शहरी क्षेत्रों की महिला जनसंख्या में तम्बाकू चबाने के पश्चात् महत्व के क्रम में धूम्रपान तथा ना बुझे तम्बाकू का उपभोग दूसरे क्रम में आते हैं।

2.2.9 गुजरात में महिला जनसंख्या में तम्बाकू उपभोग के रूप में नसवार सूंघना काफी फैला हुआ है (प्रति 1000 पर

ग्रामीण जनसंख्या में 64 तथा शहरी में 26 थी)। यह किसी अन्य प्रमुख राज्य में नहीं पाया गया था।

2.2.10 तम्बाकू उपभोग के विभिन्न चार रूपों में से प्रत्येक के बारे में किए गए सर्वेक्षणों के निष्कर्षों पर पृथक-पृथक विचार-विमर्श किया जाएगा।

2.3 धूम्रपान

अंतरराज्यीय भिन्नता

2.3.1 नियमित धूम्रपान का '10' पुरुष जनसंख्या का हरियाणा के ग्रामीण क्षेत्रों में 40 प्रतिशत से अधिक, पश्चिम बंगाल (43 प्रतिशत), राजस्थान (42 प्रतिशत) तथा आन्ध्र प्रदेश (41 प्रतिशत) थे। ग्रामीण क्षेत्रों में, प्रमुख राज्यों में पुरुष धूम्रपान का सबसे कम समानुपात पंजाब (10 प्रतिशत), बिहार (12 प्रतिशत) तथा महाराष्ट्र (14 प्रतिशत) था।

2.3.2 शहरी क्षेत्रों में पुरुषों में, प्रमुख राज्यों में धूम्रपान का उच्चतम उदाहरण पश्चिम बंगाल तथा हरियाणा (30 प्रतिशत) तथा महाराष्ट्र में (11 प्रतिशत) निम्नतम था।

2.3.3 आन्ध्र प्रदेश के ग्रामीण क्षेत्रों में प्रमुख राज्यों में 10 वर्ष और इससे अधिक आयु के नियमित महिला धूम्रपान का उच्चतम समानुपात (7 प्रतिशत) था, इसके अनुसरण में हरियाणा (5 प्रतिशत) तथा राजस्थान तथा उत्तर प्रदेश (11 प्रतिशत) थे।

2.3.4 शहरी क्षेत्रों में महिला धूम्रपानकर्ताओं का समानुपात केवल आन्ध्र प्रदेश और राजस्थान (15-16 प्रतिशत) में 1 प्रतिशत बढ़ा है। ग्रामीण और शहरी क्षेत्रों दोनों में महिला धूम्रपानकर्ताओं का समानुपात पंजाब में सबसे कम (0.1 प्रतिशत) था।

पुरुष-महिला अंतर

2.3.5 समस्त-भारत : महिलाओं में नियमित धूम्रपानकर्ताओं के उदाहरण (ग्रामीण भारत में प्रति 1000 पर 23 तथा शहरी भारत में प्रति 1000 पर 7) थे, जो सामान्य तौर पर सभी स्थानों पर पुरुषों में धूम्रपान की तुलना में काफी कम थे। शहरी क्षेत्रों में पुरुषों और महिलाओं के मध्य सापेक्ष अंतर काफी अधीन था। जहां पुरुष दर (प्रति 1000 पर 202) महिला दर काफी उच्च लगभग 29 गुणा, ग्रामीण क्षेत्रों में लगभग 13 गुणा थी।

2.3.6 अंतर-राज्यीय भिन्नता : ग्रामीण आन्ध्र प्रदेश में महिलाओं में नियमित धूम्रपानकर्ताओं के उदाहरण प्रति हजार पर 69 था जिसका अभिप्राय है कि पुरुषों में उदाहरण (प्रति 1000 पर 413) महिलाओं से केवल 6 गुना था। महिला-पुरुषों में भी अंतर ग्रामीण-बिहार के क्षेत्रों में अंतर (पुरुष हेतु 120 तथा महिलाओं के मध्य अंतर भी पंजाब में काफी अधिक तथा कर्नाटक तथा तमिलनाडु में अधिक था।

ग्रामीण-शहरी अंतर

2.3.7 समस्त-भारत : ग्रामीण क्षेत्रों में महिलाओं में धूम्रपान के उदाहरण (प्रति 1000 पर 23) शहरी क्षेत्र के तिगुने थे। ग्रामीण क्षेत्रों में पुरुषों के (धूम्रपान) उदाहरण शहरी क्षेत्रों से केवल डेढ़ गुना थे।

2.3.8 अंतर-राज्य भिन्नता : पंजाब ही केवल एक प्रमुख राज्य पाया गया है जहां पुरुषों में ग्रामीण आभास की तुलना में धूम्रपान शहरों में अधिक है। शहरी क्षेत्रों पर प्रति 1000 पर 154 तथा ग्रामीण क्षेत्रों में यह प्रति 1000 पर 96 है। उड़ीसा में, पुरुषों में (प्रति 1000 पर 225-226) शहरी और ग्रामीण दर बराबर पाई गई है। अन्य सभी प्रमुख राज्यों में पुरुष और महिला दोनों में धूम्रपान के उदाहरण शहरी क्षेत्रों की तुलना में ग्रामीण क्षेत्रों में उच्चतर (या कम से कम उससे कम नहीं) पाए गए। उड़ीसा के अतिरिक्त, तमिलनाडु में शहरी-ग्रामीण अंतर कम है (194 ग्रामीण पुरुष तथा 190 शहरी पुरुष) तथा केरल में तथा महाराष्ट्र में भी ऐसा ही है।

आयु के अनुसार भिन्नता

2.3.9 सारणी 1आर और 1 यू का भाग-1। राज्य, संघ शासित क्षेत्र तथा समस्त-भारत प्रत्येक में पुरुष और महिलाओं में नियमित धूम्रपान या किसी भी रूप में तम्बाकू के उपभोग की विशिष्ट आयु पर दर्शाता है। पांच आयु समूह 10-14, 15-24, 25-44, 45-49 तथा 49 मागे गए हैं। 1987-88 तथा 1993-94 के मध्यम विभिन्न रूपों में तम्बाकू के उपभोग (नियमित) के उदाहरण की विशिष्ट आयु दर की तुलना हेतु विवरणी 5 देखें। इस अवधि के दौरान पुरुष और महिला दोनों की सभी आयु समूह हेतु इस अवधि के दौरान दर कम हुई है।

पुरुष

2.3.10 समस्त भारत स्तर पर प्रत्येक वृद्धि की और अग्रसर आयु समूह 10 से 14 से प्रारंभ करके 45-49 तक की आयु समूह में पुरुषों में धूम्रपान की घटनाओं में वृद्धि हुई है जो धूम्रपान में उच्चतम दर दर्शाती है (लगभग 50 प्रतिशत) इसके बाद इसमें आयु वृद्धि के साथ-साथ धूम्रपानकर्ताओं के समानुपात में ह्रास हुआ है। पंजाब को छोड़कर जहां धूम्रपानकर्ताओं का उच्चतम समानुपात 25-44 आयु-समूह में पाया गया है, प्रत्येक प्रमुख राज्य में आयु में भिन्नता का यही पैटर्न पाया गया है।

महिलाएं

2.3.11 पुरुषों की पाई गई स्थिति के विपरीत महिलाओं में नियमित धूम्रपानकर्ताओं का समस्त-भारत समानुपात प्रत्येक वृद्धि की और अग्रसर आयु समूह से अंतिम आयु समूह 60 तक वृद्धि पाई गई हालांकि अत्यधिक वृद्धावस्था में इसे प्रयत्नपूर्वक पूरा रोकने की प्रवृत्ति भी दिखी है। हालांकि कुछ राज्यों जैसा कि पश्चिम बंगाल तथा उड़ीसा में इस पैटर्न की पुष्टि नहीं होती है फिर भी उन राज्यों को मिलाकर इनमें महिला धूम्रपानकर्ताओं का समानुपात उच्चतम है (आन्ध्र प्रदेश, हरियाणा, राजस्थान तथा उत्तर प्रदेश) अधिकांश राज्यों में यही पैटर्न है।

सामाजिक समूह के अनुसार भिन्नता

2.3.12 इन सारणियों में तम्बाकू उपभोग की घटनाएँ कुल जनसंख्या में प्रतिशत (न केवल 10 वर्ष और इससे अधिक आयु वाले) के अनुसार जांचा जाता है तथा अनुमान के साथ परिणाम अन्य विस्तृत सारणियों तथा विवरणियों में दर्शाए से कुछ कम है। तथापि, ये तीन सामाजिक समूहों में तम्बाकू उपभोग को व्यवहार में लाने की घटनाओं में भिन्नता के निर्धारण प्रयोजन हेतु पर्याप्त है।

2.3.13 परिणाम दर्शाते हैं कि ग्रामीण और शहरी क्षेत्रों दोनों में गैर-अनुसूचित जाति/अनुसूचित जनजाति जनसंख्या की तुलना में अनुसूचित जाति तथा अनुसूचित जाति तथा जनजाति में धूम्रपान अधिक प्रचलित है। शहरी क्षेत्रों में अनुसूचित जाति तथा अनुसूचित जाति की तुलना में अनुसूचित जनजाति का प्रतिशत उच्चतर था किन्तु अनुसूचित जनजाति और अनुसूचित जाति का यह अंतर अनुसूचित जाति/अनुसूचित जनजाति तथा

गैर अनु.जाति/अनु.जनजाति जनसंख्या की तुलना में कम था। महिलाओं हेतु, ग्रामीण और शहरी दोनों क्षेत्रों में नियमित धूम्रपान करने वालों के उदाहरण अनुसूचित जाति की तुलना में अनुसूचित जनजाति के उच्चतर पाए गए तथा पुनः गैर-अनुसूचित जाति/अनु.जाति की तुलना में अनुसूचित जनजाति में उच्चतर पाई गई थी। यह नोट कर लिया जाए कि बहुत से राज्यों ने समस्त भारत पैटर्न की भी पुष्टि नहीं की है। उदाहरणार्थ, ग्रामीण मध्य प्रदेश तथा उत्तर प्रदेश में अनुसूचित जनजाति की तुलना में गैर अनुसूचित जाति/अनु.जनजाति जनसंख्या में धूम्रपान करने वालों की संख्या अधिक थी। तथापि, अनुसूचित जाति के पुरुषों में नियमित धूम्रपान करने वालों की संख्या गैर अनु.जाति/अनु.जनजाति की तुलना में प्रत्येक प्रमुख राज्य में अधिक थी।

2.4 तम्बाकू (ज़र्दा, दोक्ता आदि) को चबाना

अंतर-राज्यीय भिन्नता

2.4.1 पुरुष : बिहार (34 प्रतिशत) में 10 और इससे अधिक आयु के ग्रामीण पुरुषों का तम्बाकू चबाने वालों का समानुपात उच्चतम था इसके बाद महाराष्ट्र, उड़ीसा तथा मध्य प्रदेश (25 से 27 प्रतिशत) तथा उत्तर प्रदेश (19 प्रतिशत) था। 7 प्रमुख राज्यों में यह समानुपात 5 प्रतिशत या इससे कम था।

2.4.2 शहरी क्षेत्रों में तम्बाकू चबाने वालों का समस्त भारत प्रतिशत 8 प्रतिशत था। प्रमुख राज्यों में बिहार (20 प्रतिशत) तथा उड़ीसा (19 प्रतिशत) में तम्बाकू चबाने वालों की उच्चतम दर थी।

2.4.3 महिलाएं : तम्बाकू चबाने वाली महिलाओं का समानुपात उच्चतम से सभी अधिक उड़ीसा में (ग्रामीण 22 प्रतिशत तथा शहरी 12 प्रतिशत) पाई गई थी। ग्रामीण महाराष्ट्र में 20 प्रतिशत महिलाएं जबकि पश्चिम बंगाल और मध्य प्रदेश के ग्रामीण क्षेत्रों में लगभग 7 प्रतिशत महिलाएं तथा तमिलनाडु, केरल, कर्नाटक, उत्तर प्रदेश तथा असम के ग्रामीण क्षेत्र और पश्चिम बंगाल तथा महाराष्ट्र के शहरी क्षेत्र की 4.5 प्रतिशत महिलाएं तम्बाकू चबाती थीं। ग्रामीण क्षेत्रों हेतु समस्त-भारत समानुपात 5 प्रतिशत तथा शहरी क्षेत्रों हेतु 2.6 प्रतिशत थी।

पुरुष-महिला अंतर

2.4.4 ग्रामीण और शहरी दोनों क्षेत्रों में समस्त भारत स्तर

पर महिलाओं की तुलना में पुरुषों में तम्बाकू चबाना लगभग तीन गुना अधिक प्रचलित था। किन्तु महत्वपूर्ण क्षेत्रीय भिन्नताएँ मौजूद थीं। तमिलनाडु में पुरुषों की तुलना में महिलाओं में ये घटनाएँ थोड़ी सी उच्चतर थी तथा केरल में पुरुषों की तुलना में लगभग डेढ़ गुणा थी। अन्य सभी प्रमुख राज्यों में महिलाओं की तुलना में पुरुषों में यह आदत बहुत सामान्य थी। यद्यपि, उड़ीसा और ग्रामीण पश्चिम बंगाल में पुरुष-महिला अंतर अपेक्षाकृत कम था, तथापि बिहार पुरुषों में तम्बाकू चबाने वाला उच्चतम राज्य था जो बृहद रूप से पुरुषों के आधिपत्य का था, महिलाओं में ये दर पुरुषों की तुलना में एक बट्टा दस से भी कम थी।

ग्रामीण-शहरी अंतर

2.4.5 ग्रामीण क्षेत्रों में मोटे तौर पर ज़र्दा, दोक्ता चबाने वालों का समस्त-भारत समानुपात मोटे तौर पर शहरी क्षेत्रों की तुलना में दोनों में पुरुष (प्रति 1000 पर 151, ग्रामीण और प्रति 1000 पर 80 शहरी) तथा महिलाएं (प्रति 1000 पर 53 ग्रामीण तथा प्रति 1000 पर 26 शहरी) दुगुना है।

2.4.6 तथापि, काफी संख्या में राज्यों अर्थात् पश्चिम बंगाल (पुरुष), राजस्थान, गुजरात (पुरुष, असम (पुरुष) तथा हरियाणा के शहरी क्षेत्रों की तुलना में ग्रामीण क्षेत्रों में तम्बाकू का चबाना ज्यादा फैला हुआ है।

सामाजिक समूह के अनुसार भिन्नता

2.4.7 पुरुष : समस्त भारत स्तर पर नियमित रूप से तम्बाकू चबाने वालों का प्रतिशत ग्रामीण क्षेत्रों में अनुसूचित जनजाति हेतु 16 प्रतिशत, अनुसूचित जाति हेतु 12 प्रतिशत तथा अन्य हेतु 10 प्रतिशत था तथा शहरी क्षेत्रों में अनुसूचित जनजाति हेतु 9-10 प्रतिशत, अनुसूचित जनजाति हेतु 8 प्रतिशत तथा अन्य हेतु 6 प्रतिशत था। नोट कर लें कि ये प्रतिशत सभी आयु की जनसंख्या से संबद्ध हैं तथा विवरणी 2-4 में दर्शाए प्रतिशत से कम है।

2.4.8 महिला : तम्बाकू चबाने का समानुपात ग्रामीण क्षेत्रों में अनुसूचित जनजाति हेतु 8 प्रतिशत, अनुसूचित जाति हेतु 4 प्रतिशत तथा अन्य हेतु 3 प्रतिशत तथा शहरी क्षेत्रों में अनुसूचित जनजाति और अनुसूचित जाति हेतु 3 और 4 प्रतिशत के मध्य तथा अन्य हेतु 2 प्रतिशत था।

2.4.9 अतः नियमित तम्बाकू चबाने वाले व्यक्तियों, पुरुष तथा महिलाओं का प्रतिशत अनुसूचित जनजाति में उच्चतम था तथा यह प्रवृत्ति ग्रामीण क्षेत्र में ज्यादा दिखाई दी।

2.5 नसवार का उपयोग

अंतर-राज्यीय भिन्नता

2.5.1 नियमित नसवार प्रयोक्ताओं का समस्त-भारत समानुपात ग्रामीण क्षेत्रों में प्रति 1000 पर 7 तथा शहरी क्षेत्रों में प्रति 1000 पर 4 था। तथापि, यह आदत काफी कम प्रचलित है ये आँकड़े कुल मिलाकर दिए गए हैं किन्तु कुछ राज्यों में ये आदत है जिनमें उड़ीसा और गुजरात आम तौर पर महत्वपूर्ण हैं। ग्रामीण उड़ीसा में पुरुष जनसंख्या का प्रति 1000 पर 77 तथा महिला जनसंख्या का प्रति 1000 पर 35 नियमित प्रयोक्ताओं का बैठता था। गुजरात में, इन उदाहरणों की दर ग्रामीण महिलाओं हेतु प्रति 1000 पर 64 तथा शहरी महिलाओं हेतु प्रति 1000 पर 26 थी किन्तु पुरुष हेतु प्रति 1000 पर यह दर 3 से 5 थी, दूसरे शब्दों में, यह आदत, राज्य की महिला जनसंख्या में अधिकता से पाई गई। नसवार लेने वालों का समानुपात पुरुषों में तमिलनाडु, ग्रामीण पश्चिम बंगाल तथा शहरी उड़ीसा तथा ग्रामीण महाराष्ट्र तथा हरियाणा की महिलाओं में लगभग 1 प्रतिशत और मध्य प्रदेश तथा असम के पुरुषों में 1 प्रतिशत से कुछ कम है। अन्य सभी प्रमुख राज्यों में यह समानुपात 0.5 प्रतिशत से कम था।

पुरुष-महिला अंतर

2.5.2 जैसा कि पहले उल्लेख किया है, गुजरात में नसवार लेना अधिकांशतः महिलाओं की आदत देखी गई है। यही बात राजस्थान और हरियाणा के लिए भी सत्य प्रतीत होती है। ग्रामीण महाराष्ट्र में महिलाओं में यह आदत सामान्य है। अन्य अधिकांश प्रमुख राज्यों में यह आदत पुरुषों में अधिक सामान्य पाई गई।

ग्रामीण-शहरी अंतर

2.5.3 पश्चिम बंगाल के अलावा, जहां स्पष्ट तौर पर नसवार लेने की आदत ग्रामीण क्षेत्रों की तुलना में शहरी क्षेत्रों में ज्यादा फैली है, इसके साथ शायद कर्नाटक तथा आन्ध्र प्रदेश में, अन्य

राज्यों में शहरी क्षेत्रों की तुलना में ये उदाहरण ग्रामीण क्षेत्रों में अधिक है।

सामाजिक समूह के अनुसार भिन्नता

2.5.4 विवरणी (111) दर्शाती है कि ग्रामीण क्षेत्रों में अनुसूचित जनजाति जनसंख्या में अनुसूचित जाति तथा गैर अनु.जाति/अनु.जनजाति जनसंख्या की तुलना में नसवार लेने वाले व्यक्तियों पुरुष तथा महिलाओं का समानुपात उच्चतर था तथा यह भी कि नसवार सूंघने वालों की संख्या अनु.जनजाति के पुरुषों की तुलना में अनु.जनजाति की महिलाओं में उल्लेखनीय रूप से उच्चतर थी। शहरी क्षेत्रों में, अनु. जनजाति तथा अनु.जाति जनसंख्या दोनों में पुरुषों की तुलना में महिलाओं में नसवार सूंघना अधिक प्रचलित था तथा जबकि अनु. जनजाति/अनु.जाति की महिलाओं में 'अन्यों' की तुलना में नसवार सूंघने के उदाहरण अधिक थे, पुरुषों में 'अन्यों' में यह संख्या अधिक थी।

2.6 बुझा तम्बाकू पाउडर या पेस्ट का उपयोग

अंतर-राज्यीय तथा पुरुष-महिला अंतर

2.6.1 राज्य जिनमें बुझा तम्बाकू पाउडर या पेस्ट का उपयोग व्यापक स्तर पर फैला हुआ है वे थे - उड़ीसा और महाराष्ट्र। इन दोनों राज्यों में पुरुषों की तुलना में महिलाओं में यह आदत अधिक सामान्य थी। उड़ीसा में लगभग 20 प्रतिशत ग्रामीण महिलाओं तथा 11 प्रतिशत शहरी महिलाओं में यह आदत थी तथा 15 प्रतिशत ग्रामीण पुरुषों तथा 11 प्रतिशत शहरी पुरुषों में भी यह आदत थी। ग्रामीण महाराष्ट्र में यह संख्या महिलाओं में 15 प्रतिशत तथा पुरुषों में 12 प्रतिशत थी। शहरी महाराष्ट्र में यह काफी कम महिलाओं में 4 प्रतिशत तथा पुरुषों में 3 प्रतिशत थी।

2.6.2 दूसरी और बिहार में, बुझे तम्बाकू का उपयोग अधिकांशः पुरुष जनसंख्या (ग्रामीण और शहरी दोनों में 6 प्रतिशत) था। समस्त भारत स्तर पर यह समानुपात कमोबेशी पुरुष और महिलाओं हेतु वही है (ग्रामीण हेतु 3.3 - 3.5 प्रतिशत तथा शहरी क्षेत्रों हेतु 1.3 से 1.5 प्रतिशत)। ऊपरलिखित तीन राज्यों के अलावा केवल एक राज्य मध्य प्रदेश था जहां समग्र देश के औसत से यह प्रतिशत उच्चतर था। ग्रामीण तमिलनाडु में इस आदत वालों की संख्या समग्र भारत वाली संख्या 3.5 प्रतिशत

के लगभग थी। अन्य सभी राज्यों में यह संख्या समस्त भारत औसत से नीचे थी।

2.6.3 आन्ध्र प्रदेश, महाराष्ट्र तथा पश्चिम बंगाल में बुझे तम्बाकू का उपयोग पुरुषों की तुलना में महिलाओं में अधिक सामान्य था, इसी प्रकार उड़ीसा और महाराष्ट्र का मामला भी है।

ग्रामीण-शहरी अंतर

2.6.4 बुझा तम्बाकू पाउडर या पेस्ट का उपयोग देश के शहरी क्षेत्रों की तुलना में ग्रामीण क्षेत्रों में अधिक फैला हुआ था। सभी प्रमुख राज्यों में यह पाया गया था।

सामाजिक समूह के अनुसार अंतर

2.6.5 ग्रामीण क्षेत्रों में बुझे तम्बाकू के उपयोग का प्रचलन अनुसूचित जनजाति में उच्चतम तथा अन्यो की तुलना में अनुसूचित जाति में थोड़ा सा उच्चतर था। शहरी क्षेत्रों में अनुसूचित जनजाति तथा अन्य दो समूहों के मध्य अंतर और भी अधिक गौर करने लायक था।

2.7 किसी भी प्रकार से तम्बाकू का उपभोग

अंतर-राज्यीय भिन्नता

2.7.1 पुरुष : समूचे भारत हेतु 10 वर्ष और इससे अधिक आयु के ग्रामीण पुरुषों का किसी भी प्रकार या अन्य में नियमित तम्बाकू उपभोग 43 प्रतिशत सूचित किया गया। 11 प्रमुख राज्यों हेतु प्रतिशत का क्रम 42 प्रतिशत और 53 प्रतिशत के मध्य रहा। उच्चतम प्रतिशत वाले दो राज्य 53 प्रतिशत उड़ीसा और मध्य प्रदेश थे इन दोनों में ज़र्दा या दोक्ता चबाने वालों की संख्या बहुत उच्च थी। हालांकि बाद वाली विशेषता बिहार और महाराष्ट्र में भी मौजूद हैं। इन दो राज्यों में ग्रामीण पुरुषों में नियमित तम्बाकू उपभोग का प्रतिशत वहां धूम्रपान के निम्न समानुपात के कारण 44-45 प्रतिशत था। पंजाब के ग्रामीण पुरुषों में तम्बाकू उपभोग की आदत वालों की संख्या निम्नतम के करीब (12 प्रतिशत), इसके बाद तमिलनाडु 27 प्रतिशत और उसके बाद केरल (31 प्रतिशत) तथा कर्नाटक (34 प्रतिशत) था।

2.7.2 शहरी क्षेत्रों में पुरुषों में तम्बाकू उपभोग में धूम्रपान की आदत की ही अधिकता थी। पंजाब (17 प्रतिशत) को छोड़कर अंतर-राज्यीय भिन्नता काफी कम थी, पुरुष तम्बाकू

प्रयोक्ताओं का समानुपात 22 प्रतिशत और 41 प्रतिशत के मध्य तथा समस्त भारत औसत 28 प्रतिशत थी। पश्चिम बंगाल जहां शहरी धूम्रपान करने वाले पुरुषों का समानुपात उच्चतम था प्रमुख राज्यों में उच्चतम दर थी। इसके अनुसरण में असम तथा उड़ीसा (38 प्रतिशत) था। यदि कभी-कभी तम्बाकू का उपभोग करने वालों पर भी विचार किया जाए तो असम पश्चिम बंगाल के बराबर हो गया था।

2.7.3 महिलाएं : यह देखा गया था कि अधिकांश राज्यों के ग्रामीण क्षेत्रों में महिला धूम्रपानकर्ताओं का समानुपात 2 प्रतिशत से कम था केवल 1 प्रतिशत से भी कम शहरी क्षेत्रों में थी। दूसरी ओर, बहुत से राज्यों में खासतौर पर ग्रामीण क्षेत्रों में ज़र्दा, दोक्ता आदि चबाना अधिक प्रचलित था। ये आदतें हैं जिन्हे 'किसी भी प्रकार से तम्बाकू का उपभोग का महिलाओं में उपभोग दर्शाती हैं। उड़ीसा के ग्रामीण क्षेत्रों पर विचार करते समय जहां 22 प्रतिशत महिलाएं निमित रूप से तम्बाकू चबाने तथा 20 प्रतिशत बुझा तम्बाकू पाउडर या पेस्ट का उपयोग करती हैं, से लगता है कि 42 प्रतिशत महिलाएं समान रूप या अन्य रूप में तम्बाकू का उपयोग कर रही हैं। यह दूसरे उच्चतम समानुपात (25 प्रतिशत) महाराष्ट्र द्वारा सूचित से भी काफी उच्चतर है। इसके बाद 8 और 12 प्रतिशत ग्रामीण महिला तम्बाकू प्रयोक्ताओं वाले छः राज्य आन्ध्र प्रदेश ग्रामीण महिला धूम्रपानकर्ताओं का उच्च समानुपात, मध्य प्रदेश तमिलनाडु आते हैं जहां ज़र्दा/दोक्ता तथा बुझा तम्बाकू दोनों महत्वपूर्ण हैं। पश्चिम बंगाल (मुख्यतयः तम्बाकू चबाने पर) तथा गुजरात (मुख्यतया नसवार पर आधारित) किसी एक प्रकार या अन्य में नियमित तम्बाकू उपभोग करने वाली ग्रामीण महिलाओं का समस्त भारत समानुपात 11 प्रतिशत था।

2.7.4 उड़ीसा के शहरी क्षेत्रों में भी नियमित तम्बाकू उपभोग करने वाली महिलाओं का समानुपात भी काफी अधिक (22 प्रतिशत) था। महाराष्ट्र, मध्य प्रदेश तथा पश्चिम बंगाल में शहरी महिलाओं में तम्बाकू उपभोग का उदाहरण 6 से 8 प्रतिशत था। उड़ीसा और महाराष्ट्र में तम्बाकू चबाने तथा बुझे तम्बाकू के उपभोग का योगदान का समानुपात विशिष्ट था जबकि मध्य प्रदेश और पश्चिम बंगाल में तम्बाकू चबाना पहले ही अधिक है। नियमित तम्बाकू उपभोग की आदत वाली शहरी महिलाओं का समस्त भारत समानुपात 5 प्रतिशत से थोड़ा कम था।

पुरुष-महिला तथा ग्रामीण-शहरी अंतर

2.7.5 विशिष्ट आदतों के स्तर (जैसा कि धूम्रपान, नसवार सूंघने आदि) के स्तर पर भलीभांति समझने के लिए निष्कर्षों पर अध्याय 3.3 से 3.6 में विचार-विमर्श किया गया है।

आयु के अनुसार भिन्नता

2.7.6 आयु के अनुसार तम्बाकू उपभोग की भिन्नताओं हेतु ग्रामीण और शहरी दोनों क्षेत्रों हेतु, एक समान पैटर्न है एक पुरुषों हेतु तथा दूसरा महिलाओं हेतु जैसा कि धूम्रपान हेतु पाया गया था। एक बिन्दु तक आयु में वृद्धि के साथ पुरुष नियमित तम्बाकू उपभोग करने वालों का समानुपात आयु समूह 45-59 हेतु उच्चतम था तथा इसके बाद घटा है। 45-49 के आयु-समूह में किसी भी रूप में तम्बाकू उपभोग करने वाले पुरुषों का समानुपात ग्रामीण क्षेत्रों में 61 प्रतिशत तथा शहरी क्षेत्रों में 41 प्रतिशत है। 15 से 24 वर्ष की आयु समूह में ग्रामीण और शहरी अंतर चौंकाने वाला है ग्रामीण क्षेत्रों में 19 प्रतिशत नियमित प्रयोक्ताओं की तुलना में शहरी क्षेत्रों में केवल 9 प्रतिशत है।

2.7.7 दूसरी और महिलाओं में आयु बढ़ने के साथ-साथ तम्बाकू उपभोग के उदाहरण में उच्चतम आयु समूह (60) तक वृद्धि पाई गई। आयु समूह 60 में महिलाओं में नियमित, तम्बाकू प्रयोक्ताओं का समानुपात ग्रामीण क्षेत्रों में 21 प्रतिशत तथा शहरी क्षेत्रों में 13 प्रतिशत है। ग्रामीण क्षेत्रों में 15 से 24 आयु समूह की महिलाओं में तम्बाकू उपभोग करने वाली महिलाएं शहरी क्षेत्रों की तुलना में लगभग चार गुना हैं।

सामाजिक समूह के अनुसार भिन्नता

2.7.8 यहां विचार किए गए तीन सामाजिक समूह में से तम्बाकू उपभोग की उच्चतम आदतों वाले अनुसूचित जनजाति, इसके बाद अनुसूचित जाति तथा इसके बाद गैर अनु.जनजाति/ अनु.जाति की जनसंख्या को (विवरणी 5) में दर्शाया गया है। अनुसूचित जाति-जनजाति के पुरुषों में अंतर कम है खास तौर पर शहरी क्षेत्रों में। समूची जनसंख्या में अनु. जनजातियों से संबंधितों में तम्बाकू उपभोग की आदतों के पूर्व अधिकता के संदर्भ में ग्रामीण और शहरी दोनों क्षेत्रों में महिलाओं में बहुत चौंकाने वाले हैं।

2.8 एक प्रकार की अपेक्षा अधिक रूपों में तम्बाकू का उपभोग

2.8.1 सभी राज्यों तथा संघ शासित क्षेत्रों हेतु ना केवल लिंग के अनुसार अपितु विभिन्न आयु समूहों हेतु भी भाग-1। (सारणी 2 आर और 2 यू) में अनुमानों सहित विस्तृत परिणाम प्रस्तुत किए गए हैं।

2.8.2 देश में एक या अन्य रूप में तम्बाकू उपभोग करने वाले प्रति 1000 ग्रामीण पुरुषों में से कुल 451 में से केवल 73 ने एक से अधिक रूप में तम्बाकू उपभोग किया जिनमें से धूम्रपान और तम्बाकू चबाने वालों का सम्मिलन ज्यादा (प्रति 1000 पर 55) था। शहरी क्षेत्रों में प्रति 1000 पर तम्बाकू उपभोग करने वाले 296 पुरुषों में से 30 ने एक से अधिक रूप में तम्बाकू उपभोग किया। इनमें से 25 धूम्रपान करने के साथ-साथ तम्बाकू चबाने वाले भी है। महिलाओं में देश के ग्रामीण क्षेत्रों में प्रति 1000 पर केवल 8 और शहरी क्षेत्रों में प्रति 1000 पर 3 एक से अधिक रूपों में तम्बाकू का उपभोग करती है।

2.8.3 धूम्रपान और तम्बाकू चबाने का समिश्रण ग्रामीण क्षेत्रों में काफी राज्यों : असम, उत्तर प्रदेश, बिहार तथा पश्चिम बंगाल में प्रति 1000 पर 60 या इससे अधिक (6 प्रतिशत या इससे अधिक) पुरुषों में पाया गया। इन राज्यों के शहरी क्षेत्रों में प्रति 1000 पर 30 या इससे अधिक पुरुषों में यही आदत थी। ग्रामीण बिहार तथा उड़ीसा में धूम्रपान तथा तम्बाकू चबाने का समिश्रण अकेले धूम्रपान की तुलना में ज्यादा सामान्य था।

2.8.4 जर्दा/दोक्ता चबाने तथा बुझे तम्बाकू के उपयोग का संयोजन महाराष्ट्र में ग्रामीण पुरुषों का 6 प्रतिशत तथा उड़ीसा में ग्रामीण तथा शहरी पुरुषों का लगभग 5 प्रतिशत देखा गया था। उड़ीसा ग्रामीण में 3 प्रतिशत महिलाओं तथा ग्रामीण महाराष्ट्र में 1.5 प्रतिशत महिलाओं में इन आदतों का संयोजन था।

2.8.5 धूम्रपान और बुझे तम्बाकू का संयोजन ग्रामीण और शहरी उड़ीसा के पुरुषों में 6 प्रतिशत तथा शहरी बिहार और हरियाणा के ग्रामीण क्षेत्रों बिहार, असम तथा महाराष्ट्र में लगभग 1.2 प्रतिशत था।
