THE NATIONAL SAMPLE SURVEY

THIRTYFIRST ROUND : JULY 1976 - JUNE 1977

SURVEY ON USE OF ELECTRICITY FOR DOMESTIC PURPOSE
AND POWER FOR PUMPS IN ELECTRIFIED VILLAGES
IN RURAL AREAS

1. INTRODUCTION : A survey on use of power (electricity/diesel) in rural areas was conducted in the thirtyfirst round of the National Sample Survey in the agricultural year July 1976 to June 1977. The Survey covered the whole of rural India excepting the states of Nagaland and Sikkim ; district Ladakh of Jammu & Kashmir ; tehsils Pal and Samri of district Surguja and tehsils Nijapur, Danteware, Konta and Harayanpur of district Bastar of Madhya Pradesh ; tehsils Rajura, Sironcha and Gadchiroli of district Chandrapur and tehsil Nalgat of district Amravati of Maharashtra and Union Territories of Andaman & Nicobar Islands, Arunachal Pradesh, Chandigarh, Dadra and Nagar Haveli, Lakshadweep and Mizoram.
2. SAMPLE DESIGN : The broad design was a stratified two-stage one with villages as first-stage units and households as second-stage units. The list of 1971 census villages was used as the sampling frame for the selection of sample villages. A total of 8472 sample villages was selected for survey in all-India out of which 8461 villages were actually surveyed and the rest 11 samples became casualty. The sample villages were drawn in the form of two independent sub-samples to keep provision for calculation of errors and four independent sub-rounds to get proper seasonal representation of the data collected in the year.
3. Stratification : Each state/union territory was divided into a number of regions by grouping contiguous districts (tehsils in Gujarat) having similar crop-pattern, density of population in rural areas and other socio-economic and topographical features. A total of 64 regions were formed in all-India and each region was divided into a number of strata. In general, each district was treated as a stratum. However, larger districts having 1971 census rural population 1.5 million or more were divided into a number of strata depending on their 1971 census rural population content by grouping contiguous tehsils having similar characteristics.

....p/2.

so/

4. Allocation : The all-India sample size of 8472 villages were distributed to different states and union territories in consideration of the respective strength of field staff available to conduct the survey. Next, allocation for a state or union territory was allocated to its constituent regions in proportion to the respective total irrigated area with some adjustments for area having large rural population content but much less irrigated area. Region-wise allocation was so made in consideration of another major enquiry, namely, performance of irrigation conducted in the same set of sample villages alongwith enquiry on use of power. Lastly, the region allocation was distributed over its constituent strata in proportion to the respective 1971 census rural population.

5. Selection of villages : Within each stratum, sample villages were selected with probability ^{proportional} to population and with replacement. Unit of selection was the census village. In cases where census village could not be uniquely identified, the corresponding revenue village (s) was surveyed. Sample villages with large population content were divided into a number of hamlet-groups having nearly equal population content and the survey was confined to one of the hamlet-groups selected at random.

6. Data on use of electricity for domestic use were collected in the "Household Schedule 23.1 (use of electricity for domestic purpose)" from a sample of households in each sample village. Data on power operated pump sets in the household sector were collected in the "Household Schedule 22.1 (particulars of irrigation in the household holding)" from a sample of households in each sample village (electrified villages only). Results obtained from schedules 23.1 and 22.1 are presented in Parts Three and Four respectively of this report. Number of sample villages allotted and actually surveyed and number of sample households surveyed for schedules 23.1 and 22.1 are shown in Table 1.

7. Sample households : Total number of sample households in a state/ union territory was distributed over its constituent regions and strata in proportion to population and next, allocation for a region so as to survey a fixed number of sample households (h) in all the sample villages in a region. This h was a fixed number for a region but value of h differed from region to region. Households were selected from each sample village circularly systematically after suitably arranging all the

households in the village by type of irrigation used and size of agricultural holding. Household schedule 23.1 was canvassed in all the sample households which uses electricity for domestic purposes. Household schedule 22.1 was canvassed in all the sample households which cultivated land during 1976-77 with irrigation and also in the sample households which cultivated land during 1976-77 without irrigation but usually used irrigation for cultivation. Number of sample villages and number of households surveyed for schedule 22.1 and 23.1 are given in Table 1.

B. Estimation :

Notations

- r : subscript for r-th region of a state/union territory
- s : subscript for s-th stratum
- i : subscript for i-th surveyed village/hamlet-group
- j : subscript for j-th sample household
- f : adjustment factor for surveying revenue village
- m : number of surveyed villages
- h : number of sample households
- D : number of hamlet-groups actually formed in a village
- p : village population (used for selection)
- P : total rural population (used for selection)
- H : total number of households
- y : value of a characteristic
- Y : total of y for all the sub-samples combined
- \hat{Y} : estimate of Y

\hat{Y} for a characteristic is given by

$$\hat{Y} = \sum_r H_r \sum_s \sum_{i=1}^{m_{rs}} \sum_{j=1}^{h_{rsi}} y_{rsij}$$

where $\frac{H_r}{\sum_s \sum_i h_{rsi}}$ and \sum_j runs over all the

households surveyed for the respective schedule 22.1 or 23.1 in the i-th village. H_r is estimated total number of households in the r-th region. \sum_s denotes summation over all the strata in r-th region and \sum_r denotes summation over all the regions in the state/union territory.

9. Concepts and Definitions : Concepts and definitions of important items adopted in the survey are given below.

10. Village electrified : A village was considered as electrified only if there was at least one service connection (including street light) to it. A village having a transformer or sub-station located within the village but without any service connection to it was not considered as electrified. Also villages which were having electricity power not from a general grid but generated by local auto generator were not considered as electrified.

11. Use of power : Use of power included use of both electricity and diesel. Diesel included Kerosene when used as substitute for diesel. Different purposes for use of power are listed below.

(a) Domestic : Domestic purposes meant use of electricity for light, fan, radio, domestic appliances like heater, iron etc. for domestic consumption only. The actual purpose for which electricity was used and not the tariff under which the electricity charges were paid was considered.

(b) Agricultural : Agricultural purposes related to the use of electricity or diesel for running the pump sets for irrigation of land for production of crops only.

(c) Industrial/Commercial : Industrial/commercial purposes related to the use of electricity or diesel for industrial and commercial purposes. Use of power for agricultural enterprises like poultry, preservation of food etc. were treated as use of power for industrial/commercial purposes.

Explanatory note on tables

1. General : In some cases, the entries were rounded up to integers or 10 for each cell of a table but the row or column total was arrived not by adding the rounded entries in each cell but by rounding up at the total level; total being arrived by adding the un-rounded figures in each cell. Thus totals may differ marginally from the totals arrived by adding individual cell entries. For similar reasons, all-India figures may also differ slightly from the totals arrived by adding state figures.

2. Table 3.5 : Column (4) indicates the cost incurred by the households for service connection upto the meter meant for domestic use and column (6) indicates the cost incurred by the households for internal wiring of the house for domestic use of electricity upto the date of survey. This cost included the expenses for wires, switches, plugs, labour charges for fittings etc. but excluded expenses for bulbs or other appliances.

3. Table 3.6 : The number of points related to the points provided whether in use or not. A plug used for running a fan was treated as a plug point and not a fan point. If a switch was provided for running any electrical appliance for domestic use, other than light or fan, that point was treated as a plug point. Half plug was treated as one plug point.

4. Table 3.7 : This table gives the number of electricity operated domestic appliances possessed by the households on the date of survey. Appliances used for both domestic and non-domestic purposes was treated as domestic appliances. The number possessed included hired appliances also, if any, on the date of survey. The number of appliances included battery operated appliances also when the household was found using electricity for domestic purpose. Battery operated appliances possessed by the households not using electricity for domestic purpose were excluded.

5 Table 3.8 : Table 3.8 gives the value of electricity consumed by the households using electricity for domestic purpose for all the purposes and not only for domestic purpose. Total value paid for the consumption of electricity under different tariffs related to the electricity charges paid or to be paid against the last monthly bill, in case, the bill was not a monthly one, proportionate adjustment was done for the last month. The value included the meter rent also. In many cases, information on quantity (unit) of electricity consumed last month could not be ascertained from the payments and thus not recorded in the schedules. Hence data on quantity of electricity consumed has not been presented. However, the estimates of value of consumption only cannot offer a regional comparability due to varying tariffs. In some cases, the tariff under which the electricity charges were paid could not be ascertained. Such cases are shown under 'tariff not known'. The value related to the actual tariff under which the charges were paid or to be paid and not to the purpose for which the electricity was used.

6 In sub-heading of tables 3.1.0 to 3.1.23 the word 'purposed' wherever occurred may be read as 'purposes'. The per capita expenditure class '200—' wherever occurred may be read as '200 and above'. The heading of tables 3.3.0 to 3.3.23 may be read as follows : "Estimated no. of households using electricity for domestic purposes by principal and subsidiary household industry". The word 'estimated' may be added in the beginning of the heading of tables 3.4.0 to 3.4.23. The heading of tables 3.5.0 to 3.5.23 may be read as follows : "Estimated no. of households using electricity for domestic purposes, cost for service connections and internal wiring and total no. of electric points by structure type of houses". In the sub-heading of tables 3.7.0 to 3.7.23 the word 'present' may be read as 'possessed'.

SUMMARY RESULTS

1. The total number of households using electricity for domestic purpose in the rural areas of India was about 6.8 million which was about 13.3 percent of households residing in the electrified villages and about 7.7 percent of all rural households in India. Among the households using electricity for domestic purpose, 35.4 percent households started using electricity during last 5 years or more and the rest 64.6 percent within last 5 years, 15.9 percent within last one year only. Among these households, 83.5 percent households belonged to per capita expenditure class Rs.43.00 or more. Only 37.2 percent of households were found with highest educational level in the households 'secondary and above'. Only 7.5 percent households belonged to social groups schedules caste, scheduled tribe and neo-Buddhists.

2. Out of about 6.8 million rural households using electricity for domestic purpose, 63.2 percent households were having agriculture as principal household industry, 69.3 percent households were not having any subsidiary industry and 33.7 households cultivated less than 0.002 hectare net area of land during last year.

3. Out of households using electricity for domestic purpose, 67.5 percent households were found living in houses with both roof and wall pucca. Average cost incurred for service connections was found to be about Rs.105 per household in all types of houses. Average cost incurred for internal wiring was found to be about Rs.225 per household with about 9.4 electric points per household taking light, fan and plug points together. Average number of light points per household was 5.1. about 22.1 percent of households using electricity for domestic purposes reported having fan points with an average of about 1.5 fan points per household. Average is calculated ignoring the fact that the accounted connections had been obtained in different years.

.....p/8.

4. About 2.5 million rural households were found to possess electrical appliances which was 36.6 percent of households found using electricity for domestic purposes. Among the households found possessing some electrical appliances 56.9 percent was found possessing fan. This percentage was 65.7 for radio, 1.6 for cooking heater, 8.1 for iron and negligible for other appliances. Average number of appliances per reporting household was about 1.5, the bulk of which belonged to fan and radio. Average number of electric points and electric appliances per household was found to be higher in households belonging to higher per capita expenditure group. Appliances like television, geyzer, kettle, refrigerator etc. were found only in households which belonged to per capita expenditure group Rs.55 and above.

5. Average monthly value of electricity consumed for any purpose per household in households using electricity for domestic purpose was about Rs.10.94 out of which 71.1 percent of charges were paid under domestic tariff, 14.1 percent under agricultural tariff, 13.2 percent under industrial tariff, 1.2 percent under commercial tariff and for the rest 0.4 percent the actual tariff was not known.

6. Total number of pumpsets used for irrigation in electrified villages was about 52 ^{Lakh} out of which about 33 ^{Lakh} was operated by electricity and about 19 ^{Lakh} by diesel. These figures exclude diesel operated pumpsets in un electrified villages. Among those using diesel operated pumpsets, 16.0 percent reported that they could not use electricity operated pumpsets because electricity was not available to them for the purpose though the village was electrified.
