NATIONAL SAMPLE SURVEY
28TH ROUND : OCTOBER 1973 - JUNE 1974
TABLES WITH NOTES ON MORBIDITY
CHAPTER ONE

INTRODUCTION

1.1. In the twenty eight round of the National Sample Survey (NSS) information ~~particulars~~ on morbidity was collected along with the enquiry on births, deaths, migration and disability^{a/}. Information on morbidity was collected with reference to last 2 weeks preceding the date of survey from all members present in the sample households on the date of enquiry as well as visitors in the households. Morbidity was defined as sickness/injury/poisoning.

Information on sickness/injury/poisoning affecting members of the household including visitors during the 2 weeks preceding the date of enquiry together with ancillary information like age and sex of the person, nature of the ailment etc. was collected. Also along with information on morbidity data on chronic ailments prevailing among the members on the date of survey were collected.

1.2. The survey covered the whole of India excepting Ladakh district of Jammu & Kashmir, Mizoram, Arunachal Pradesh, Andaman & Nicobar Islands, Lakshadweep, Minicoy and Amindivi Islands, Dadra and Nagar Haveli, rural areas of Chandigarh and Nagaland, some rural areas in Tripura and in the districts of Sarguja and Bastar of Madhya Pradesh and ~~Chandrapur~~ Chandrapur and Amravati of Maharashtra.

1.3. The survey started in October 1973 and continued upto June 1974 and the survey period of nine months was split up into three sub-rounds of three months duration each. Data were collected from the sample households by the interview method. Broadly, the sample design was a stratified two stage one with village/urban blocks being first stage units and households as the second stage units and self-weighting at the state level separately for the rural and the urban sectors. In all, from about 1.29 lakhs of rural and 0.67 lakh urban households the relevant data on morbidity were collected. The present tables on morbidity are based on such data. The sample design and procedure of estimation are described in Appendix I.

a/ : Information on morbidity was also collected in seventeenth round of NSS from about 8,600 rural households and 4,400 urban households distributed over 4,310 villages & 2,237 urban blocks.

CHAPTER TWO
CONCEPTS AND DEFINITIONS

2.1. Household normally resident members and visitors : Persons who usually lived together and took food from the same kitchen were considered as usual or normally resident members of the household. Other members not usually residing in the household were classified as visitors. If a person lived in a place and took food at some other place, he was considered usual member at the place where he lived. Inmates (including the staff) of a mess, hotel, orphanage, etc. were treated as single member households. However, a family living in any one of the establishments was treated as a separate household by itself.

2.2. Morbidity was defined as sickness which included injury and poisoning also. Sickness meant any deviation from the state of physical and mental well being with a specific cause. Chronic ailments ~~and the associated~~ ~~xxxxxxx~~ were not, however, treated as morbidity.

2.3. The following categories of spells of morbidity could occur during a reference period.

- (a) Spells starting before the first day of the reference period and terminating within the reference period.
- (b) Spells starting and terminating within the reference period.
- (c) Spells starting within the reference period and continuing on the date of survey.
- (d) Spells starting before the first day of the reference period and continuing on the date of survey.

2.4. Incidence rate is defined by

$$\frac{\text{estimated number of spells (b + c)}}{\text{estimated population exposed to risk}} \times 1000$$

$$= 1000 \times \frac{\text{estimated number of spells starting within the reference period}}{\text{estimated population exposed to risk}}$$

The incidence rate measures the frequency of morbidity commencing during the reference period

2.5. Prevalence rate is defined by

$$\frac{\text{estimated number of spells (a+b+c+d)}}{\text{estimated population exposed to risk}} \times 1000$$

$$= 1000 \times \frac{\text{estimated number of spells prevailing in the reference period}}{\text{estimated population exposed to risk}}$$

The prevalence rate measures the frequency of morbidity prevailing in the reference period.

CHAPTER THREE
SUMMARY FINDINGS

3.1. Table 1 below presents incidence and prevalence rates of morbidity for all-India separately by states. From the table it is seen that at all-India level the incidence rate of morbidity per one thousand persons was 12.57 and 13.53 respectively for the rural and the urban sectors^{b/}.

Table 1 : Incidence and prevalence rate of morbidity by states and all-India, rural & urban areas.

states	incidence rate		prevalence rate	
	rural	urban	rural	urban
(1)	(2)	(3)	(4)	(5)
1. Andhra Pradesh	20.89	18.20	31.94	27.84
2. Assam	8.46	5.94	17.40	11.66
3. Bihar	4.69	6.05	10.16	11.42
4. Gujarat	4.48	2.85	10.17	6.26
5. Haryana	9.23	8.46	15.96	16.47
6. Jammu & Kashmir	11.42	9.22	17.79	12.80
7. Karnataka	8.44	7.24	14.92	13.35
8. Kerala	37.29	33.77	71.21	61.84
9. Madhya Pradesh	10.34	11.34	20.89	21.72
10. Maharashtra	17.78	20.06	27.57	32.18
11. Orissa	14.53	17.19	24.20	24.38
12. Punjab	19.25	16.68	27.47	24.62
13. Rajasthan	10.20	7.46	17.33	12.55
14. Tamil Nadu	20.65	21.01	33.99	31.98
15. Uttar Pradesh	7.95	6.27	13.22	10.54
16. West Bengal	11.35	17.30	27.71	33.85
17. All-India ^{b/}	12.57	13.53	22.46	22.77

[1/ All states and union territories under NSS coverage]

It also appears from the table that there were wide variation in the incidence rate between the states. Kerala with an incidence rate of 37.29 and 33.77 respectively in the rural and the urban sectors tops the list. This was followed by Tamil Nadu with a rate of 20.65 and 21.01 in the rural and urban sectors. The states Andhra, Maharashtra, Bihar, Orissa, Punjab and Tamil Nadu had incidence rates both in the rural and the urban sectors higher than the all-India rate. With regard to prevalence rate it is seen from the table that at all-India the prevalence rate of temporary ailments was 22.46 and 22.77 respectively in the rural and the urban sectors. Kerala here again tops the list with a rate of 71.21 in the rural and 61.84 in the urban sectors. This was followed by Tamil Nadu with a rate of 33.99 and 31.98. The states Andhra, Maharashtra, Orissa and Punjab had rates higher than the all-India rates.

^{b/} The incidence and prevalence rates of morbidity of NSS 28th round as estimated are somewhat lower than the rates as observed in the 17th round of the NSS presented in NSS No.129 : Report of Pilot Enquiry on Morbidity. A seminar meeting was held in July 1977 under the auspices of NSSO to examine vital rates and migration and morbidity rates of NSS 28th round and the consensus was that the morbidity rates could be released even though the estimates of NSS 28th round appeared somewhat lower than those of the Pilot Enquiry on Morbidity.

3.2. Table 2 presents incidence and prevalence rates of morbidity by type of ailment for all-India. From the table it is seen that excepting the group 'others' and 'not recorded' the incidence rate of influenza was highest both in the rural & urban areas. It was 2.2 per 1000 persons in both the sectors. In the rural sector influenza was followed by malaria with a rate of 1.1. The incidence rate of malaria in the urban sector was not so high. The prevalence rate of influenza also exceeded the corresponding rates of other ailments in both the sectors. Malaria and dysentery also had a comparatively high rate. The prevalence rates estimated for influenza, malaria and dysentery were 3.1, 1.8 and 1.3 in rural areas and the corresponding rates for the urban sector being 3.2, 1.2 and 1.3.

Table 2 : Incidence and prevalence rate of morbidity by type of temporary ailments for all-India, rural and urban areas

type of ailments (1)	incidence rate		prevalence rate	
	rural (2)	urban (3)	rural (4)	urban (5)
1. cholera	0.03	0.03	0.05	0.04
2. typhoid	0.12	0.19	0.35	0.44
3. dysentery	0.74	0.79	1.34	1.29
4. diarrhoea	0.27	0.22	0.46	0.33
5. diphtheria	0.02	0.01	0.03	0.01
6. whooping cough	0.33	0.25	0.84	0.60
7. tetanus	0.01	0.01	0.02	0.03
8. acute poliomyelities	0.01	0.02	0.03	0.05
9. small pox	0.38	0.44	0.63	0.79
10. measles	0.17	0.14	0.31	0.30
11. mumps	0.03	0.08	0.05	0.12
12. malaria	1.13	0.71	1.77	1.15
13. influenza	2.16	2.15	3.10	3.24
14. pneumonia	0.13	0.05	0.20	0.11
15. food poisoning	0.02	0.04	0.03	0.04
16. accident	0.39	0.54	0.80	1.01
17. others	4.34	5.16	8.27	8.51
18. not recorded	2.29	2.70	4.18	4.71
19. all ailments	12.57	13.53	22.46	22.77

3.3. Incidence and prevalence rates of morbidity broken down by age is shown in table 3. Both incidence and prevalence rates of sickness as revealed in table 3 was highest in the first year of age and gradually diminished as age increased. It was minimum in the age group 15-24 and then again rose higher with the age. The pattern was observed both in the rural and urban areas of all-India. The incidence rates per 1000 person at age '0' were estimated as 21.09 for rural and 30.29 for urban sectors. The corresponding prevalence rates for rural and urban sectors were 35.72 and 49.34 respectively.

Table 3 : Incidence and prevalence rate of temporary ailments by age for all-India, rural and urban

age in years	incidence rate		prevalence rate	
	rural	urban	rural	urban
(1)	(2)	(3)	(4)	(5)
0	21.09	30.29	35.72	49.34
1-4	20.65	24.36	35.50	39.04
5-14	10.04	11.02	17.15	18.14
15-24	9.53	9.30	16.38	14.97
25-44	12.04	13.64	22.10	23.13
45-59	13.64	13.41	25.51	25.24
60 & above	13.67	12.97	28.78	25.57
not recorded	103.98	-	180.54	-
all ages	12.57	13.53	22.46	22.77

3.4. Average duration of selected temporary ailments which terminated in recovery during the reference period is presented in table 3 by type of ailment. It is seen from the table that at all-India level average duration of all temporary ailments taken together was about 8.2 and 6.7 days in the rural and the urban sectors respectively. There was, however, some variation by type of ailments. In the rural sector, the duration of typhoid was 18.8 days while the duration of measles, mumps, small pox & malaria was about 8-10 days. In the urban sector similarly the duration of typhoid was about 16 days while the duration of small pox, mumps, measles & malaria was about 8-10 days.

Table 4 : Average duration (days) of selected temporary ailments terminating in recovery by type of ailments for all-India, rural and urban areas

type of ailments	duration of temporary ailments	
	rural	urban
(1)	(2)	(3)
1. cholera	5.70	5.32
2. typhoid	18.84	16.43
3. diphtheria	5.15	7.00
4. whooping cough	10.52	6.92
5. small pox	10.33	10.13
6. measles	9.61	8.31
7. mumps	9.02	8.27
8. malaria	8.36	6.54
9. influenza	6.66	5.76
10. pneumonia	7.94	7.46
11. food poisoning	12.95	11.14
12. accident	10.73	7.20
13. all ailments	8.16	6.68

3.5. Information on chronic ailments prevailing among the members of the household are presented in table 5. It is seen that the incidence rate of all chronic ailments taken together was 2098 and 1962 per 1,00,000 persons in the rural and urban sectors. It is also seen that asthma was the most prevalent chronic ailment, both in the rural and urban areas. High blood pressure with a rate of 44 in the rural sector compared to 132 in the urban sector appears to be more urban specific. The number of persons suffering from this ailment came to 376 in the rural areas and 355 in the urban areas per 1,00,000 persons. The next most important chronic diseases were rheumatism and tuberculosis in both the rural and urban areas, the number of cases being respectively 251 and 117 in rural whereas 146 and 137

Table 5 : Number of persons suffering from chronic diseases per 1,00,000 persons by type of chronic disease for all-India, rural & urban areas

type of chronic disease (1)	number of persons	
	rural (2)	urban (3)
1. tuberculosis	117	137
2. leprosy	40	25
3. syphilis	8	6
4. cancer	12	14
5. thyroid trouble or goitre	22	16
6. diabetes	39	80
7. mental illness	19	18
8. epilepsy	28	17
9. rheumatic fever	45	26
10. high blood pressure	44	132
11. bronchitis	41	43
12. asthma	376	355
13. peptic ulcer	89	66
14. kidney stone or kidney trouble	37	40
15. arthritis	22	17
16. rheumatism	251	146
17. stroke	13	13
18. piles	65	61
19. others	194	128
20. not recorded	636	629
21. all types	2098	1962

in urban areas. High blood pressure with a rate of 132 in the urban sector compared to 44 in the rural sector appears to be more urban specific.

APPENDIX - I

SAMPLING DESIGN AND ESTIMATION PROCEDURE

A stratified two stage design was adopted for the survey. The first stage units were villages in the rural sector and blocks in the urban sector and the second stage units were households from which the information was collected.

The whole of India was divided into 524 basic strata so that the basic strata did not cut across district boundaries. A district with more than 1.5 million 1971 census rural population formed 2 or more basic strata (by grouping contiguous tehsils) depending on their rural population. In Gujarat, however districts with population less than 1.5 million were divided into two strata in consideration of dry areas and concentration of tribal population at the request of SSB of that state.

Within each State and Union Territory the allotted number of villages and blocks were distributed over the constituent basic strata in proportion to their rural and urban population respectively.

The 1971 census list of villages was used as the sampling frame for selection of villages. Sample villages within each basic stratum were selected with probability proportional to population and with replacement in the form of two independent sub-samples.

All cities and towns within each basic stratum were grouped into a number of urban sub-strata. All towns with 1971 census population less than 20,000 formed sub-stratum 1, towns with 1971 population 20,000 to 49,999 formed sub-stratum 2 and those with 1971 population 50,000 to 99,999 formed sub-stratum 3. Each city with 1971 population 1,00,000 or more constituted a separate urban sub-stratum. Within each urban stratum, the allocated number of blocks was further allocated to the constituent sub-strata circular systematically with probability proportional to urban populations of the respective sub-strata. Within each urban.

sub-stratum, the allocated number of blocks were selected with probability proportional to size and with replacement.

Villages and blocks with large population content were divided into two or more compact areal sub-divisions of nearly equal population content. One of these sub-divisions (called hamlet in a village and sub-block in a block) was selected at random and the survey was confined to the selected sub-division only.

All households in a sample village/hamlet group were arranged into 6 classes on the basis of their means of livelihood viz., (i) landless labour, (ii) cultivator and (iii) others and whether (i) visited health centre or (ii) not. All households in a sample block/sub-block were also arranged into 6 classes by occupation divisions (0-1 and 2,3,4,5,6 and 7-8-9 and X). From the arranged frame in a village/block, a sample of households was selected linear systematically using the intervals and random start specified. Sampling intervals were so fixed as to make the design selfweighting at the state level separately for rural and urban sectors.

Unbiased method of estimation was adopted for estimating aggregate values of the characteristics, say, X, Y, Z, etc. under enquiry. Estimates of ratios were derived by dividing unbiased estimates of the numerators by the unbiased estimates of the denominators.

SNC.

Appendix - II
Statistical Tables

A list of tables included in this
is given below :

	<u>page no.</u>
Table (1R) : Incidence rate of temporary ailments by type of ailment separately by sex for different states and all-India : rural households, NSS 28th round.	1
Table (1v) : Incidence rate of temporary ailments by type of ailment separately by sex for different states and all-India : Urban households, NSS 28th round.	4
Table (2R) : Incidence rate of temporary ailments by age separately by sex for different states and all-India : rural households, NSS 28th round.	7
Table (2U) : Incidence rate of temporary ailments by age separately by sex for different states and all-India : urban households, NSS 28th round.	9
Table (3R) : Prevalence rate of temporary ailments by type of ailments separately by sex for different states and all-India : rural households, NSS 28th round	11
Table (3U) : Prevalence rate of temporary ailments by type of ailments separately by sex for different states and all-India : Urban households, NSS 28th round.	14
