THIRTYFIFTH ROUND JULY 1980 - JUNE 1981

REPORT ON
THE EXPLORATORY SURVEY ON CONSTRUCTION
SCHEME - A

CHAPTER ONE DESCRIPTION OF THE SURVEY

INTRODUCTION

Data relating to the various aspects of construction activity are needed, among others, by the National Building Organisation and the Central Statistical Organisation. While the former is interested mainly in addition to housing stock, expenditure on building materials and labour and the various sources of finance for building construction, the latter is interested in construction statistics in order to ascertain the contribution of the construction industry to national income and capital formation.

The total construction activity in the country can be divided into four sectors by the agency undertaking construction as follows: 1) Government (central, state and local bodies); 2) Corporate bodies (public sector undertakings, and public and private joint stock companies); 3) other non-household organisation (co-operative societies, religious and charitable institutions, etc.) and, finally, 4) households (including proprietary and partnership enterprises). The National Sample Survey Organisation has attempted from time to time to collect data on construction activity carried out in the household sector.

The enquiries carried out by NSS on building construction in the household sector were of varying scope and coverage. In some rounds (22 to 24, 27, 28) simple counts of new buildings completed during one year preceding the date of survey were taken. Information on expenditure on building materials, labour and other services utilised for building construction was

- 1.3 collected in enquiries covering capital formation in some other rounds (15, 17, 26, 37). During 1971-74 a comprehensive survey on investment and financing of building construction was carried out in the urban sector outside the framework of the usual NSS socio-economic rounds. An enquiry with the same subject coverage was carried out in NSS 27th round in the rural sector.
- 1.4 Despite this previous experience in conducting surveys on building construction, some problems of design and methodology still remained. So it was decided to conduct a fresh exploratory survey on construction in the thirtyfifth round of NSS (July 1980 - June 1981). The 35th round survey comprised of two "schemes". Under scheme A, a full fledged survey on construction was undertaken in the sample villages and urban blocks selected for the main socio-economic enquiry of this round. This was intended to provide estimates relating to the various aspects of construction activity. Unlike in previous enquiries in this round the construction works were listed at their site and samples of construction works were selected for detailed enquiry from among them after suitable stratification. (Prior to this, households who had engaged in construction activity were listed and samples were selected from among them; that is to say the sampling unit was the household). The other scheme, Scheme B, was meant to study the usefulness of municipal sanction lists as a sampling frame for selection of sample building constructions. This was carried out only in the urban sector in an independent sample of towns. The report on the Scheme B part has already come out. (NSS Report No.335). The present report gives the results obtained from the Scheme A enquiry.
- 1.5 The report is divided into two parts. Part I, includes the descriptive part of the report and the all-India tables for rural and urban sectors and the big cities pooled. (8 cities Ahmedabad, Bangalore, Bombay, Calcutta, Delhi, Hyderabad, Kanpur and Madras with population above 10 lakhs and above as per 71 census). Part II will include all the State-wise tables which will be presented separately for groups of states.

In this report a description of the survey is given in the following paragraphs of this chapter (chapter one). Important results are discussed in chapter two which includes, towards the end, a brief discussion on the reliability of the results (see chapter two, Part I of the report)

The following appendices follow :-

- Appendix I : Sample Design and estimation procedure
" II : Results : (i) List of Tables
(ii) Tables

BROAD SURVEY DESIGN

The NSS 35th round was comprised of a survey on social consumption and the exploratory survey on construction. The scheme A part of the latter was integrated with the social consumption survey in that both were carried out in the same sample villages and urban blocks. The construction survey in the rural sector was however, carried out only in one-half of the sample villages selected viz. the villages of sub-sample I.

The ultimate sample units for the construction survey were "construction works", which included both buildings and non-building construction works. The coverage of the survey was confined to all "pucca" and "semi-pucca" building constructions (which comprises both new buildings and additions, alterations and improvements) as well as all non-building works on which some expenditure on construction was incurred during the 365 days preceding the date of listing, excluding those carried out in the public sector and the private corporate sector. All constructions on which the expenditure (during last year) was less than Rs.100/- were however excluded). Sample constructions were selected in two stages as usual in NSS. The villages in the rural sector and the blocks in the urban sector were the first stage sampling units. In each sample f.s.u., all constructions identified at their site falling within the coverage of the survey were listed and

then divided into two sub-strata. sub-stratum-1 comprising all building constructions and sub-stratum-2, all non-building constructions. A sample of 4 building works were selected from sub-stratum-1, sub-stratum-2 was completely enumerated.

THE SURVEY SCHEDULE

- 1.9 The survey schedule, viz. schedule 1.4 Particulars of construction was canvassed in all sample constructions. It consisted of mainly three blocks of information to be collected in respect of the sample construction (besides the identification particulars). Block 3 contained items relating to the general characteristics of the sample construction such as the nature of construction (new building, addition, alteration etc. road, well ponds etc.) who undertook the construction, purpose, duration and similar items. Some of these particulars are informative in themselves while others are used as classificatory variables. Block 5 is perhaps the most important block in which data on expenditure during last year on materials, labour and services were collected. The items are listed in detail and for some important and reasonably homogeneous items the quantity consumed during the year has also been collected. Finally, in block 6 of the schedule information on the source of the finance arranged for executing the sample construction work has been collected. This was divided into three broad heads : borrowings from employer, borrowing from other sources and others, with each of these sub-divided further into number of categories.
- 1.10 It may be mentioned here that many practical difficulties had been reported by the field staff in getting at correct information, especially when, besides the main contractors are also involved in executing the work; and also when the owner and/or the contractor was not resident in the sample village/town

CONCEPTS AND DEFINITIONS

Some of the important concepts and definition employed in the survey reported upon are given below

i) Building : A building is an independent free standing structure comprising of one or more rooms and/or other spaces covered by a roof and usually enclosed within external walls and dividing walls which extend from the foundation to the roof.

i) New construction (of building) New construction is defined as the erection of an entirely new structure irrespective of whether the site on which it is built is already occupied or not.

ii) Addition, alteration and improvement of building This is extension and/or betterment of existing structures intended to increase the usefulness of the structures by making provision for additional floor space and/or amenities or to extend the life of the structures. Any type of remodelling or renovation or major repair work will be covered under this. Repairs and routine maintenance will not be considered.

A building construction may be either a 'new construction' or 'addition, alteration and improvement'.

iii) Non-building construction is any construction work other than building construction. The term inter alia covers : walls, roads, irrigation projects, platforms, laying of drains, sewers, bridges, culverts etc.

iv) Type of structure : Buildings are classified as "pucca", "semi-pucca" and "katcha" on the basis of the materials used in construction. A pucca structure is one whose walls and roof are both built with pucca materials. Pucca materials are burnt bricks, stone blocks, cement, concrete, Jack-board, timber, corrugated iron or asbestos sheets (the last, if used for roof) etc. If both walls and roof are semi-pucca materials, the house is "katcha". If wall or roof (but not both) are built with pucca materials, it is "semi-pucca".

(vii) Owner (of a construction work) : The sector to which a construction belongs is decided by the owner of the construction. The owner is an individual, agency or collective body on whose account the construction is carried out at the time of construction. For example, in the case of a housing cooperative society constructing a block of flats which will be subsequently handed over to the members, the owner at the time of construction is the society for the purpose of this survey.

(viii) Commencement of construction : Construction is considered as begun when the first physical operation such as site preparation, delivery of materials and equipment at the site, start of excavation or laying of foundation after the planning and designing is completed. In case there is any break in the process of construction, the commencement will refer to the initial commencement.

(ix) Completion of construction : A building construction is regarded as completed if it is considered by the owner to be ready for first occupation.

(x) Expenditure on construction during last year : This is the cost of construction incurred during the reference period of 365 days preceding the date of survey which includes : (i) materials used (ii) wages payable to the labour engaged and (iii) the charges payable for the services utilised. The expenditure will relate only to the items and amounts actually used in the construction work during the reference period. Any item of expenditure on materials etc. not used in the construction is not included in this.

Materials might have been purchased on cash or credit, obtained from home, received as gift, or free collections, Those received as gift were evaluated at current market prices, and those supplied from home at "ex farm" or "Ex-factory" rates. For free collections only transport charges and other incidental charges were taken into account. (Evaluation of any used material used in the construction was based on the current market price of such items; however, such expenditure was not included in total expenditure).

(ix) Source of finance The sources of the finance arranged for a construction consists of (i) borrowing from employer (ii) borrowing from other sources and (iii) other sources. The last mentioned covers savings, pensions and other retirement benefits, inherited wealth, subsidy and grants, gifts etc. In the case of borrowings, the total amount of loan used or intended to be used for the construction work under survey was taken into account irrespective of whether all of it has been used or not. In the case of other sources (saving, etc.) only the amount actually used was considered. Finance for purchase of land was not included under this item.

APPENDIX - I

SAMPLE DESIGN AND ESTIMATION PROCEDURE

- I.1 The main features of the sample design and estimation procedure adopted in NSS 35th round in respect of the scheme A part of the exploratory survey on construction are given in the following paragraphs.
- I.2 Geographical Coverage : The survey covers the whole area of the Indian union excepting : Sikkim; Ladakh district of Jammu and Kashmir; rural areas of Pal and Samri tehsils of district of Surguja and Bijapur, Dantewara, Kanta and Narayanpur Tehsils of district Bastar of Madhya Pradesh; Rajura, Sironcha and Gadchirole tehsils of district Chandrapur and Melghat tehsil of district Amravati of Maharashtra, rural areas of Nagaland; Andaman & Nicobar Islands; Lakshadweep; Dadra and Nagar Haveli.
- I.3 Broad design : The sample design was stratified with two stage selection within each stratum. The first stage units were 1971 census villages in rural areas and urban blocks in urban areas. The second stage units were construction works.
- I.4 Stratification procedure : Each state/Union Territory is divided into a few agro-economic regions, the number of regions in a state/U.T. varying from one to five. These regions are formed by grouping contiguous districts of similar agricultural profile. The total number of regions thus formed all over India (excluding areas not covered by NSS) is 73. Strata for sampling were formed within regions. Each district with less than 1.5 million 1971 census rural population forms a basic stratum by itself except in Gujarat and Arunachal Pradesh where some districts with less than the above population have been divided into two or more basic strata.

Districts having more than 1.5 million rural population have been divided into a number of basic strata (depending upon the population of each district) by grouping contiguous tehsils homogeneous as far as possible with respect to crop pattern and density of rural population. Basic strata so formed are the basic strata for both rural and urban sectors. There are a few purely rural and purely urban basic strata as well. Some basic strata having small urban population have been merged together to form the ultimate urban strata with sizable urban population for purposes of urban sample selection. Generally each urban stratum is a district or a group of districts within the same region. Further each city with a population of one million or more forms a separate urban stratum by itself. The total number of rural strata is 540 and urban strata 352.

Allocation of f.s.u.'s to strata Within each state and Union Territory the total sample size (rural/urban) was allocated to the strata in proportion to their respective 1971 census (rural/urban) populations. The allocations were adjusted to make them a multiple of 4 at the stratum level and a multiple of 8 at the region level.

Sampling of villages The 1971 census list of villages have been used as the sampling frame. In such rural basic stratum a allocated number of villages have been selected with probability proportional to population and with replacement. presented in the form of two independent sub-samples. In North eastern state of Arunachal Pradesh cluster sampling villages have been adopted. In the rural strata, nucleus ages have been selected with equal probability and clusters been formed around them. Individual villages have been selected with equal probability in Mizoram and with probability tional to population in other states of this region.

When the sampled census village is not identifiable, one of the following procedures is adopted according to circumstance (a) if revenue villages contained wholly or partly in the census village are surveyed as one unit; or (b) the revenue village which contains the selected village and possibly other census villages is wholly surveyed.

- T.7 Sampling of blocks** : The urban frame survey (UFS) blocks of UFS-1977 scheme whenever available and UFS blocks of 1972-77 period for the remaining towns constituted the sampling frame for selection of blocks. In each urban stratum sample blocks have been selected circular systematically in the form of two independent sub-samples.
- T.8 Hamlet-group and sub-block selection** : In case the present population of a sample village or block is 1200 or more it is divided into two or more equal (in terms of population) subdivisions (hamlet-groups in the case of villages and sub-blocks in the case of blocks); the number of subdivisions depending on the population of the village or block at the time of the investigator's visit. One of them is selected at random for survey.
- T.9 Sampling of Constructions** : The constructions done by the corporate sector and the public sector, katcha buildings and also those involving an expenditure of less than one hundred rupees during last 365 days are excluded from the coverage of the survey. The remaining constructions are divided into two sub-strata; building and non-building. A sample of four building constructions is selected circular systematically from sub-stratum 1. All non-building constructions in sub-stratum 2 are selected for survey.
- I.10 Sample size** : The Central sample consisted of 8008 villages and 4500 blocks. The scheme A part was carried out only in sub-sample 1 in the rural sector (4004 villages). In the urban sector it was done in all the sample blocks. In each sample village/block, 4 sample building constructions and all non-building constructions listed were selected for detailed enquiry as explained in the previous para. Table I-1 gives the distribution of sample villages (sub-sample-1 only) and sample blocks over the states and Union Territory of India.

Table (I-1) : State-wise number of sample villages, urban blocks and towns in the Central sample

Srl. no.	State/Union territory	number of sample	
		villages	blocks
	(2)	(3)	(4)
	Andhra Pradesh	312	320
	Assam	172	120
	Bihar	376	216
	Gujarat	136	216
	Haryana	60	772
	Himachal Pradesh	80	48
	Jammu & Kashmir	160	120
	Karnataka	160	216
	Kerala	160	144
	Madhya Pradesh	320	280
	Maharashtra	280	560
	Manipur	60	48
	Meghalaya	60	48
	Nagaland		24
	Orissa	160	144
	Punjab	160	144
	Rajasthan	172	200
	Tamil Nadu	232	416
	Tripura	80	48
	Uttar Pradesh	500	512
	West Bengal	228	400
	Arunachal Pradesh	52	24
	Chandigarh	4	12
	Delhi	4	96
	Goa, Daman & Diu	12	24
	Mizoram	52	24
	Pondicherry	12	24
	All-India	4004	4500

- 1.11.1 Estimation procedure :- The total of any characteristic y is estimated by :

$$\hat{Y} = \sum_{s=1}^L \frac{P_s}{n_s} \sum_{i=1}^{m_s} \frac{f_{si} \cdot D_{si}}{P_{si}} \sum_{t=1}^2 \frac{H_{sit}}{h_{sit}} \sum_{j=1}^{h_{sit}} y_{sitj}$$

where

- s = subscript for stratum
 L = number of strata
 P_s = total rural population in rural sector except Arunachal Pradesh and Mizoram;
 m_s = total number of villages in the stratum in rural sector of Arunachal Pradesh and Mizoram;
 n_s = total number of blocks in the stratum in urban sector
 n_s = number of surveyed number of villages/blocks including depopulated and zero cases.
 i = subscript for village/block
 f_{si} = rural : adjustment factor for revenue village selection
urban : 1
 P_{si} = rural : village population used for sampling (except Arunachal Pradesh and Mizoram)
= 1 in urban sector and rural sector of Arunachal Pradesh and Mizoram
 D_{si} = number of hamlet groups/sub-blocks formed
 t = subscript for sub-stratum (1 or 2)
 H = number of constructions listed
 h = number of constructions surveyed
 j = subscript for sample construction
 y = value of characteristic under study

- 1.11.2 Sub-sample wise estimates : These were obtained from the sample villages/blocks of each sub-sample. In the rural sector, samples of sub-rounds 1 and 3 constituted s.s.1 and those of sub-rounds 2 and 4, s.s.2.

- 1.11.3 Estimates of all ratios were obtained by first estimating the aggregates appearing in the numerator and the denominator of each ratio and finally by division.

APPENDIX II

LIST OF TABLES

description

(2)

Number of sample Construction works surveyed by Construction type.

Percentage distribution of estimated number of Construction works by nature of construction and construction responsibility.

Percentage distribution of estimated number of new building Construction by plinth area, stage of Construction and type of structure.

Percentage distribution of estimated number of completed new building Construction by total cost of Construction and type of structure.

Percentage distribution of Construction expenditure incurred during the year towards building Construction work by items of expenditure, nature of Construction and type of Structure by sub-samples.

Average quantity of Consumption during the year of Construction material/labour per Construction work and average cost of Construction material/labour per standard unit by items of construction, construction type and type of structure.

Percentage distribution of estimated amount of finance used by source of finance and construction type.

Selected tables for the major states are presented in this Appendix only due to paucity of resources. However, the tables for the all India report have been retained for comparative comparison.
