ACKNOWLEDGEMENT

This report was prepared by Sali Kumar Sanyal and Sunil Kumar Sinha. J. C. Das, C. Venkateswarlu, M. S. Murty and S. C. Basu Roy were associated in the work relating to the preparation of the report.

Supervision of computing, punching and machine tabulation was entrusted to H. B. Chowdhury, M. Rakshit, A. K. Chowdhury, S. Palit, R. Roy, S. N. Das, K. C. Poddar, B. Chakravarty, B. L. Banerjee and S. Kar.

The design of the survey was prepared by the Indian Statistical Institute.

The primary data were collected by the Directorate of the National Sample Survey, Government of India, in all the States except in West Bengal, where the Indian Statistical Institute collected the relevant data.

The National Sample Survey

Seventeenth Round : September 1961—July 1962

TABLES WITH NOTES ON SOME ASPECTS OF LANDHOLDINGS IN RURAL INDIA

(State and All-India Estimates)

*This report entitled "Tables with Notes on Some Aspects of Landholdings in Rural Areas (State and all-India estimates) : Seventeenth Round, September 1961—July 1962" was prepared by the Indian Statistical Institute. The views contained in the report are not necessarily those of the Government of India.**

CHAPTER ONE

INTRODUCTION

1.1 The survey on landholdings in the seventeenth round (September 1961—July 1962) of the National Sample Survey (NSS) was an extension of a similar survey in the sixteenth round¹ having the same concepts, definitions, sampling design as also the same items of enquiry. The survey in the sixteenth round was conducted in the rural areas only while the coverage was extended to the urban areas also in the seventeenth round. The information in this report pertains however to the rural areas only. Although the main interest in the continuation of the enquiry in the seventeenth round was to pool the data of both the rounds to build up dependable estimates at the regional² level with the increased sample size, estimates of different characteristics were obtained at the State and national levels also while tabulating the data. Different aspects of landholdings in rural India have been discussed in this report namely the characteristics of ownership holdings and agricultural operational holdings in rural India as revealed by the data of seventeenth round survey. Some of the important characteristics are presented at the state level also.

1.2 An inter-departmental committee on Agricultural Census (1960) consisting of the Planning Commission, the Central Statistical Organisation, the Indian Council of Agricultural Research, the Ministry of Food and Agriculture, the Ministry of Community Development and the Directorate of National Sample Survey was set up by the Government of India which was responsible for the finalisation of the concepts and definitions adopted in the survey. While formulating the concepts and definitions for the survey, the committee took into account the recommendations put forward by the FAO in its Programme of World Agricultural Census (1960).

1.3 The information on ownership and operational holdings³ were collected by interviewing the households. While particulars of area owned, area leased out etc. were collected from each sample household, details of operational holding in respect of its area distribution, composition and utilisation, the extent of irrigation and manuring etc. were recorded for each operational holding possessed (individually or jointly with other households) by the sample households. Information on area owned by households (*i.e.* by all members of the household) on the date of survey was recorded plot by plot. In case a plot was owned jointly with other households, only the share of area owned by the sample household was taken into account. As regards operational holding information was collected for the agricultural year July 1960 to June 1961. Plots possessed by the holdings for the major part (more than six months) of the agricultural year 1960-61 were enumerated and particulars of operational holdings were recorded for each of the plots. In case an operational holding was managed jointly by more than one household, all plots either owned or leased in by the participating households and coming under the purview of the operational holding were taken into account. It may be noted that since an operational holding was comprised of lands put wholly or partly to some agricultural uses, operational holdings may be considered as agricultural holdings. For this reason, sometimes use of agricultural holdings is made in place of operational holdings in this report.

1.4 The survey was carried out in whole of India excluding Andaman and Nicobar Islands, Laccadive Minicoy & Amindivi Islands, Ladakh district of Jammu and Kashmir, North East Frontier Agency and some inaccessible areas of Manipur.

1.5 The survey started in September 1961 and ended in July 1962. The total period was split up into 6 sub-rounds of 8 weeks each.

1.6 It was planned to survey altogether 3888 villages in three independent and inter-penetrating samples, each of which could provide valid estimates of the characteristics. As the work-load in this round was very heavy in comparison to the field staff available, some investigators were recruited and were entrusted with the work of surveying the sample villages of the third sub-sample. Since there had been some delay in recruitment and training of the new investigators, villages pertaining to the first sub-round of the third sub-sample could not be surveyed. All villages belonging to third sub-sample in Orissa were not surveyed. It may also be pointed out that mainly on the considerations of availability of the investigating staff, the sampling design was so oriented as to permit only one sample in Delhi (sub-sample 1 only) and two sub-samples in Himachal Pradesh (Sub-samples 2 and 3) instead of three sub-samples. The table below gives the number of sample villages allotted and surveyed.

*The present report is the combined form of the draft reports numbering D. 140 and D. 146. D. 140 relates to land holdings, was first submitted by the Indian Statistical Institute, Calcutta to the Government of India in April, 1966 and D. 146 relating to agricultural holdings, was submitted in December, 1966. They were revised subsequently and resubmitted in July, 1967.

²Regions within each State were formed covering contiguous districts having similar crop patterns and population densities. Altogether 48 regions were formed in the whole of rural India. A report on agricultural holdings based on the data collected in the sixteenth round of the NSS covering the features required mainly by the FAO has already been published in NSS report No. 113.

³The concepts and definitions are given in chapter two.

TABLE (1.1) : Number of sample villages allotted for survey and number of sample villages actually surveyed by States, 17th Round.

States	number of sample villages	
	allotted	surveyed
(1)	(2)	(3)
1. Andhra Pradesh	306	285
2. Assam	144	131
3. Bihar	360	327
4. Gujarat	144	134
5. Jammu & Kashmir	414	322
6. Kerala	144	136
7. Madhya Pradesh	342	313
8. Madras	252	236
9. Maharashtra	288	273
10. Mysore	180	166
11. Orissa	180	120
12. Punjab	144	134
13. Rajasthan	162	146
14. Uttar Pradesh	468	429
15. West Bengal	234	217
16. Union Territories	126	117
All India	3888	3486

1.7 The results of the survey were tabulated by sub-samples and estimates for States and all-India are presented in this report for each of the three sub-samples and also by combining the three sub-sample estimates. The divergence between the sub-sample estimates provides some idea about the margin of uncertainty of the estimates. Some important features of landholdings at the national level have been summarised in Chapter three.

1.8 The field work was entrusted to the Directorate of National Sample Survey Government of India in all the States and Union territories except West Bengal where the survey was conducted by the Indian Statistical Institute. Indian Statistical Institute was responsible for the sampling design adopted in the survey and the processing and tabulation of the data.

1.9 The facsimile of the schedules of enquiry (schedules 6.1 and 6.2) are shown in Appendix III.

CHAPTER TWO

CONCEPTS, DEFINITIONS AND SAMPLING DESIGN

2.1 The concepts and definitions adopted in the survey are given in the subsequent paragraphs.

2.2 *Household.*—A group of persons who usually live together and take their meals from a common kitchen constituted a household. Whether a person satisfying the criterion of common messing would be considered as a member of the household or not was left to the judgement of the head of the household. Temporary absentees who were considered by the head of the household as members of the household were enumerated while persons like, domestic servants, private tutors, paying guests, etc. were not considered as members of the household.

2.3 *Ownership of land.*—A plot of land was considered to be owned by the household if the right of permanent heritable possession with or without the right to transfer the title was vested on a member/members of the household. Land owned by a household might be leased out to another household without losing the ownership right. In case of a plot owned jointly with other households, only the household's share of land was taken into account.

2.4 *Classification of land owned or held in owner-like possession.*—The land owned or held in owner-like possession by the households was classified as follows :

- (a) land held directly from Government under a grant, lease or assignment with
 - (i) right of permanent, heritable and transferable possession; and (ii) right of permanent and heritable possession but without the right to transfer the title; and
- (b) land held from persons other than Government with
 - (i) right of permanent, heritable and transferable possession; and
 - (ii) right of permanent and heritable possession but without the right to transfer the title.

3.4.1 In classifying land owned by households under categories 'from Government' and 'from others', the nature of ownership *as on the date of survey* was ascertained. If a plot owned by the household was held *directly* from the Government on the date of survey irrespective of whether it was acquired from the Government or not, the plot was considered to be owned and held from the Government. Lands owned and held from intermediaries on the date of survey were grouped under the category 'from others'.

2.5 *Operational holding.*—An operational holding was constituted by all lands used *wholly* or *partly* for agricultural production and was operated by the persons, alone or with the assistance of others, without regard to title, size of location. The holding might consist of one or more parcels of land provided they were situated in the same *State* and came under the purview of the same *technical unit*. Thus an operational holding was considered as one operated by a "person" and constituting one technical unit. A "person" in the definition refers to a single household or a number of households operating jointly. By technical unit was understood, in the context of agricultural operations, a unit with more or less independent technical resources etc., covering items like, land, implements, livestock etc. Hence, in the determination of an operational holding, the importance of identifying the "person" who operated and the technical unit or units under each such "person" was emphasised. In cases where more than one "person" operating land had used more or less the same technical resources, the number of operational holdings was considered to be the same as the number of such "persons" though the technical units constituting the operational holdings were more or less identical. On the other hand, number of technical units was taken as the basis for determining the number of operational holdings in cases where under the same "person" there were more than one technical unit. A holding constituted by lands put to non-agricultural uses *only* or used *exclusively* as pastures or for livestock raising or production of livestock products and/or pisciculture was excluded from the scope of the survey.

2.6 *Agricultural production.*—Agricultural production included the growing of field crops, fruits, grapes, nuts, seeds, tree nurseries (except those of forest trees), bulbs, vegetables, and flowers, both in open and under glass; production of coffee, tea, cocoa, rubber, the forest production in parcels of land which formed part of the enumeration holding, and the production of livestock and livestock products, poultry and poultry products, honey, rabbits, fur-bearing animals, silk-worm cocoons, etc., on land forming part of the enumeration holding.

2.6.1 For the purpose of the survey, a household was considered to possess at least one operational holding if it had undertaken some agricultural production individually or jointly with other households during the reference period. The operational holding might be constituted by land owned as well as land rented in by the management of the holding.

2.7 *Area rented in.*—Area leased in by a tenant (other than the tenant who was treated as an owner by virtue of owner-like possession) who had the possession over the land without the right of ownership constituted area rented in by the tenant. The tenant household might take land on lease under one or more terms of lease. The different terms of lease, on which the information was collected are as follows :

- (i) area rented in for a fixed amount of money,
- (ii) area rented in for a fixed amount of produce,
- (iii) area rented in for a share of produce,
- (iv) area for which the rent was paid partly in one and partly in other forms mentioned above,
- (v) area held on condition of rendering services either to the village community or to the Government or to an individual (also includes cases where labourers on plantation, etc. are given some land for cultivation without permanent rights) and
- (vi) area held free of rent.

2.8 *Individual and joint operational holding.*—An operational holding managed by persons belonging to one household was treated as an individual holding while that managed jointly by persons belonging to different households was considered to be a joint holding. When a household operated a holding jointly with other households, the details in respect of all land under the possession of the management were collected from the household. Thus the plots possessed by the partner households were also included in the holding provided they came under the joint management. For joint holdings, due consideration was given to the number of households participating in the management for obtaining the estimates of any characteristic relating to the joint holding¹.

2.9 *Land utilisation.*—The area under an operational holding was classified into 9 groups according to the utilisation of land. The groups are indicated below :

- (i) *Net area sown.*—This consists of net area sown with crops and orchards counting area sown more than once in the same year, only once.
- (ii) *Miscellaneous tree crops, groves etc.*—Under this class is included all culturable land which is not included under “Net area sown” but is put to some agricultural use. Lands under casurina trees, thatching grasses, bamboo bushes and other groves for fuel etc., which do not come under orchards are included under this category.
- (iii) *Pastures and grazing land.*—These cover all grazing lands irrespective of whether they are permanent pastures and meadows or not. Grazing lands within forest area are also included under this category.
- (iv) *Current fallows.*—This class comprises of cropped areas which are kept fallow during the current year (reference year July 1960 to June 1961 was taken as the current year). For example, if any seedling area in the reference year July 1960 to June 1961 was not cropped again in the same reference year, it was treated as current fallow.
- (v) *Other fallows.*—All lands which were taken up for cultivation but are temporarily out of cultivation for a period not less than one year and not more than five years covering the agricultural year 1960-61 are classed under this category.
- (vi) *Culturable wastes.*—These include land available for cultivation whether not taken up for cultivation or abandoned after a few years for one reason or other. Such lands may be either fallow or covered with shrubs and jungles which are not put to any use. These may be assessed or unassessed and may lie in isolated blocks or within cultivated holdings. Land once cultivated but not cultivated for five consecutive years ending with the agricultural year 1959-60 was included under this category.
- (vii) *Land put to non-agricultural uses.*—This stands for all lands occupied by buildings, paths etc. or under water (e.g. tanks, canals etc.) and lands, put to uses other than agricultural production.
- (viii) *Barren and unculturable land.*—Land which cannot be brought under cultivation unless at a high cost is classed as unculturable, whether such land is in isolated blocks or within cultivated holdings.
- (ix) *Forests.*—These include all actually forested area on the lands classed or administered as forests under any legal enactment dealing with forests whether State-owned or private. If any portion of such land is not actually wooded but put to some agricultural use, that portion is excluded.

2.10. *Parcels.*—An operational holding might be comprised of several parcels. For the purpose of the survey a parcel was defined as all land entirely surrounded by land of other holdings or by land not forming part of any holding. A parcel might consist of one or more cadastral units, plots or fields.

2.11 *Permanent or attached farm workers.*—Workers employed by the management of the operational holdings who were more or less in continuous employment and under some sort of contract with employers during the period of employment are considered as permanent or attached farm workers.

2.12 *Irrigation.*—Irrigation is considered to denote the practice of providing land with water other than rain by artificial means for crop production. Net irrigated area represented the area irrigated from different sources, counting area irrigated more than once during the reference period, only once.

2.13 *Drainage.*—By drainage is meant the process of removal of excess water from the surface of the land and from the surface soil for the purpose of making non-producing wet lands productive and producing wet lands more productive. However, natural drainage, that is, automatic outflow of excess water from the fields by virtue of the position of the fields was not taken into account.

2.14 *Household operational holding.*—The household operational holding was constituted by lands coming under the purview of the different operational holdings possessed by the household. If the household had individual operational holdings only, the sum of the areas of each holding constituted the household operational holding. When the household possessed only joint operational holdings, household operational holding was derived by taking the sum of the household's share of area from each of the joint holdings, the share being determined on the assumption that each co-partner household had equal amount of area. In case a household had both individual and joint holdings, the sum of the areas of all the individual holdings together with the household's share of area from each of the joint operational holdings constituted the household operational holding. Thus for households possessing only one individual operational holding, household operational holding and operational holding were identical.

2.15. *Sampling Design.*—A stratified two-stage design was adopted for this enquiry with villages as the first-stage units and households, the ultimate units.

2.16. Altogether 3888 villages were planned for this enquiry. The basis for allocation of villages to different states was the same as that adopted in the sixteenth round except for Tripura. The total sample villages for all states (except Jammu & Kashmir and Tripura) was allocated to the states on a joint consideration of their rural

¹refer to the “Estimation procedure” given at the end of this chapter.

populations and areas under food crops. The allocation to a state was finally decided on the basis of the investigating staff available and the figure so arrived was rounded off to multiple of 18. Villages in state were further allocated to its regions in proportion to the rural populations and in multiples of 18. In Jammu & Kashmir and Tripura, the number of villages to be surveyed was fixed on the basis of the investigating staff available.

2.17. Regions within states were formed by grouping contiguous districts having similar crop patterns and population densities. Identity of regions remained the same as that of the sixteenth round and altogether 48 such regions were formed in whole of India. Within each region, strata were formed covering contiguous tehsils of fairly homogeneous character with regard to their population densities in such a manner that the population of each stratum was more or less equal. The number of strata within a region was made one-eighteenth of the allocation to that region. Stratification was exactly similar to that adopted in the sixteenth round except in Manipur and Tripura. While Manipur constituted a stratum by itself, Tripura was divided into 5 strata. The total number of strata in whole of India was 216. Strata with very large area were further divided into two or more investigation zones (groups of contiguous tehsils) having more or less equal areas and three investigation zones were selected from each stratum with probability proportional to the number of villages in the zones and with replacement.

2.18. Within each stratum (with the exception of Delhi, Himachal Pradesh and Tripura), three independent sub-samples of 6 villages each were selected circular systematically with independent random starts after arranging the tehsils in order of their geographical nearness. In Tripura, from each stratum, three independent balanced linear systematic samples of 6 villages each were drawn after arranging the villages in a stratum in the increasing order of their 1951 census population. Though Delhi and Himachal Pradesh formed one stratum, 6 villages were selected from the Delhi portion to form sub-sample 1 and two sets of 6 villages each were drawn from Himachal Pradesh to form sub-samples 2 and 3. The frame used for the selection was the list of 1951 census villages but the revenue village corresponding to the selected census village was taken as the unit of survey. In case of large villages, specified number of hamlet groups of roughly equal population were formed, and one of them selected with equal probability was taken up for survey.

2.19. The survey period was partitioned into 6 sub-rounds of 8 weeks each. The investigators were grouped into 3 parties and each party was entrusted with the work of surveying an independent sub-sample of 6 villages in a stratum. Thus in each stratum, three independent and interpenetrating net work of samples of villages were surveyed by three investigators belonging to different parties. It may be noted that due to some delay recruiting the field staff allotted for the survey work in regard to sub-sample 3, villages of sub-round 1 pertaining to sub-sample 3 was abandoned due to the non-availability of staff.

2.20. It was planned to survey 90 households from the 6 villages selected for a sub-sample within each stratum. The total number of households to be interviewed was allocated to the 6 villages in proportion to their rural population as per 1951 census.

2.21. Before selecting the households in the sample villages, all households in each sample village were classified into three groups (termed as second-stage strata) depending on the land possessed by each household. For generating second-stage strata, all households were classified first into the following 10 size classes of land possessed.

class	area possessed by households (0.00 acre)
1st	upto 0.99
2nd	1.00—2.49
3rd	2.50—4.99
4th	5.00—7.49
5th	7.50—9.99
6th	10.00—14.99
7th	15.00—19.99
8th	20.00—29.99
9th	30.00—49.99
10th	50.00 & above

The households falling in the first size class, *i. e.* those possessing land less than 1 acre constituted the first 'second-stage stratum', the first half of the remaining households arranged in size classes 2 to 10 formed the second 'second-stage stratum' and the rest of households (the other half) constituted the third 'second-stage stratum'. The total number of households¹ to be surveyed in a village was allocated to the three second stage strata in proportion to the number of size classes represented in each stratum, so as to give greater weights to strata 2 and 3 than to stratum 1. A circular systematic sample of the allocated number of households was drawn from each stratum within a village.

Estimation procedure

2.22. The stratum estimate of total for any characteristic for a particular sub-sample is given by

$$\hat{T} = \frac{N_s}{n_s} \sum_{i=1}^{n_s} f_{si} \sum_{r=1}^3 \frac{H_{si}^{(r)}}{h_{si}^{(r)}} \sum_{j=1}^{h_{si}^{(r)}} X_{sij}^{(r)}$$

¹In some villages, the total number of households to be surveyed was enhanced to cover the following cases :—

- If the number of households allocated for survey was less than the number of second-stage strata, one household was sampled from each second-stage stratum.
- If the allocation to any second-stage stratum had been zero and there was at least one household in it, then one household was sampled from that stratum.

where

$X_{sij}^{(r)}$ = value of the characteristic for the j th household² of r th second-stage stratum in i th village of the s th stratum.

$h_{si}^{(r)}$ = number of households surveyed from the r th second-stage stratum in i th village of the s th stratum.

$H_{si}^{(r)}$ = total number of households in the r th second-stage stratum in i th village of s th stratum.

f_{si} = is the adjustment factor for revenue village which is as follows
 = is 1 when surveyed revenue village coincides with the sampled census village.
 = is r when the surveyed revenue village is one of r revenue villages which are wholly contained in the sampled census village.
 = is $\frac{1}{r}$, when the surveyed revenue village contains wholly r census villages one of which is the sampled census village.

D_{si} = is the number of hamlet groups formed in the i th village of s th stratum.

n_s = is the number of villages surveyed in the s th stratum.

N_s = is the total number of villages in the s th stratum.

2.23. For any character for a sub-sample, the state estimate was built up by adding the estimates of all the strata of the state and all-India estimate was obtained by summing the state estimates. The combined estimate was obtained by taking the arithmetic mean of the sub-sample estimates.

²In case of a character relating to an operational holding, X_{sij} corresponded to the sum of the values of the characteristic for the different operational holdings of the j th household in i th village of the s th stratum. For a joint operational holding the value of the characteristic was divided by the number of households participating in the joint holding before taking the sum.

Class	Number of households	Value of characteristic
1	100	100
2	200	200
3	300	300
4	400	400
5	500	500
6	600	600
7	700	700
8	800	800
9	900	900
10	1000	1000

The number of households in the first class is 100, in the second class 200, in the third class 300, in the fourth class 400, in the fifth class 500, in the sixth class 600, in the seventh class 700, in the eighth class 800, in the ninth class 900, and in the tenth class 1000. The total number of households is 5000. The value of the characteristic for each class is equal to the number of households in that class. The total value of the characteristic is 25000.

2.24. The stratum estimate for any character for a particular sub-sample is given by

$$\bar{X}_s = \frac{\sum_{i=1}^{n_s} \sum_{j=1}^{h_{si}^{(r)}} X_{sij}^{(r)}}{\sum_{i=1}^{n_s} h_{si}^{(r)}}$$

The combined estimate for the state is given by

$$\bar{X} = \frac{\sum_{s=1}^S \sum_{i=1}^{n_s} \sum_{j=1}^{h_{si}^{(r)}} X_{sij}^{(r)}}{\sum_{s=1}^S \sum_{i=1}^{n_s} h_{si}^{(r)}}$$

TABLE (3.2) : Cumulative percentage distributions of number of holdings and area of land under them by size of holding : 8th and 17th rounds of NSS.

Agricultural holdings

3.6 It may be recalled here that since a part or whole of an operational holding was put to agricultural production, it may be deemed to be an agricultural holding.

3.7 *Size distribution of holdings.*—An estimated 50.7 million of operational holdings in rural India commanding an area of 329.6 million acres was seen to be having a very uneven distribution, when arranged according to size. 17 per cent of holdings were below one acre each, having in all only 1 per cent of total area. 45 per cent of holdings were between 1 acre and 5 acres, contributing only 24 per cent of total area, whereas 3 per cent of holdings of size 30 acres or more claimed the same share of area. The unevenness of the distribution of holdings is highlighted by the fact that only 1 per cent of holdings of size 50 acres or more accounted for 12 per cent of total area operated.

3.8 *Average size and fragmentation of holdings.*—The average size of an agricultural holding was 6.49 acres and the holding was on an average constituted by 5.66 fragments, the average size of each parcel being 1.15 acres. The average area per parcel was less than an acre for holding of size upto 7.50 acres. This average size increased with the increase in holding size to 8 acres for holdings of size 50 acres or more.

3.9 *Composition of holdings.*—An operational holding was constituted by plots either owned or leased in by the management of the operational holding. The extent of the land taken on lease and the portion owned is shown in Table (3.3). 95 per cent of the operational holdings reported owned area and 24 per cent reported leased in area. 89 per cent of the operated area was owned by the holdings and the remaining *i.e.*, 11 per cent was taken on lease. Some of the holdings were of the mixed types *i.e.* were constituted by plots some of which were owned while others taken on lease. The percentage of such holdings was 19, obviously therefore, 76 per cent of the holdings were entirely owned while 5 per cent entirely leased in. 91 per cent of the holdings reported areas owned from government and the corresponding share of total area operated was 85 per cent (vide Table 8, Appendix I).

3.10 *Terms of lease.*—Out of the many forms of taking land on lease, the survey reveals that the most prevalent one was that term of lease, the rent for which was payable in proportionate share of produce. 10 per cent of holdings reported prevalence of this practice with 4 per cent of total area operated under this system. 3 per cent of total area operated was rented in on condition of paying a fixed amount of money to the lesser, with 5 per cent of holdings reporting this practice. The rest of the land taken on lease reported other practices (*vide* Table 9, Appendix I)

TABLE (3.3) : *Percentage of operational holdings reporting land owned and land leased in and their percentage shares of area owned and area leased in 1960-61 (All India).*

number of sample villages : 3486 number of sample households : 53138

srl. no.	item	estimate	percentage
(0)	(1)	(2)	(3)
1	<i>Operational holdings (000)</i>		
	(i) total number	50765	..
	(ii) number of reporting area owned	48146	94.86
	(iii) number of reporting area leased in	11929	23.52
2	<i>Area operated (000 acres)</i>		
	(i) total area	329585	100.00
	(ii) area owned	294319	89.30
	(iii) area leased in	35266	10.70

3.11. *Land utilisation within holdings.*—It will be observed from Table 16 in Appendix I that 85 per cent of total area under operational holdings was sown with crops and orchards and the remaining 15 per cent was distributed over other land uses. The estimate of area sown related to the net area which was obtained by counting the plots sown with crops and orchards more than once in the reference year only once. Tables 15 and 21 in Appendix I would show that 98 per cent of the holdings reported net area sown, the average net area sown per reporting holding being 5.67 acres. 3 per cent of area was put to non-agricultural uses. More than 3 per cent of total area operated was used for pastures and grazing land, 2.6 per cent for current fallows, about 1 per cent being cultivable waste. The average area under different utilisation per reporting holding has been shown in Table (3.4).

TABLE (3.4) : *Average area under different utilisations per reporting holding and percentages of total area operated under each utilisation, 1960-61, All India.*

srl. no.	utilisation	average area per reporting holding	percentage of total area operated
(0)	(1)	(2)	(3)
1	sown (not area)	5.67	85.83
2	misc. tree crops	0.81	0.91
3	pastures and grazing land	2.88	3.33
4	current fallows	2.09	2.63
5	other fallows	2.30	1.71
6	culturable waste	1.44	0.97
7	non-agricultural uses	0.21	2.98
8	barren and unculturable land	1.45	1.22
9	forests	3.91	0.42

3.12 The different aspects of agricultural holdings have been discussed in the preceding paragraphs dealing with the distribution according to size, the different modes of renting in land and the land uses. It remains, however, to be seen what facilities are available in the agricultural holdings, the extent of manuring and the equipments used.

3.13 *Attached farm workers.*—It will be observed from Table (22) of Appendix I that only 13 per cent of the holdings had attached farm workers. Very few of the small holdings reported attached farm workers. Even amongst the big holdings of size 50 acres or more, only 50 per cent had farm workers. The average number of attached farm workers per reporting holding differed from season to season from 0.97 in winter to 0.01 in summer.

3.14 *Irrigation facilities.*—46 per cent of the holdings reported irrigation facilities, the average area with irrigation facilities per reporting holding being 3.16. While 46 per cent of the holdings reported irrigated area, the average area irrigated per reporting holding was only 2.88. This indicates that the facilities for irrigation available to some holdings were not fully utilised. About 56 per cent of the holdings had drainage facilities. 31 per cent of holdings having drainage facilities were irrigated and 41 per cent did not report any irrigated area although having drainage facilities. The distributions of holdings reporting these facilities and the average areas per reporting holding by size of holding are given in Tables (23) to (25) of Appendix I.

3.15 The practice of using only chemical fertilisers without using other manures did not seem to be very popular, as only 9 per cent of holdings reported its use, the average area per reporting holding using only chemical fertilisers being 3.14 acres. Two-thirds of the holdings reported having resorted solely to other manuring practices the average area per reporting holding being 2.80 acres.

3.16 *Household operational holding.*—The aggregate of areas under different operational holdings possessed by a household was taken to be the household operational holding for that particular household. This concept has been discussed in detail in Chapter 2.

3.16.1 The survey reveals that there were 72.5 million rural households in India operating between them an area of 329.5 million acres. 27 per cent of the households operated no land.¹

3.16.2 *Size distribution of household operational holdings.*—It will be seen from Table (29) of Appendix I, that 36 per cent of households were operating less than half an acre, contributing almost a negligible percentage to the total operated area. About three-fourths of households were operating less than 5 acres, their share of area operated being only one-fifth. On the other hand 1.4 per cent of households operating between 30 and 50 acres accounted for 12 per cent of total area and a meagre 0.6 per cent having each 50 acres or more possessed 11 per cent of total area. This presents a very uneven distribution.

¹ Vide Table (8), page 69 of Appendix I, NSS Draft Report 140.

3.16.3 *Household size.*—The size of the household increased with the increasing holding size with the average at 5.02 of, which there were 2.96 adults and 2.06 children. An average household included 2.16 working and 2.86 not-working members. Cultivators averaged 1.23 among the working members.

3.16.4 *Livestock and agricultural implements owned by household.*—Since it was difficult to collect information on the number of livestock and implements actually used in operational holdings for different agricultural operations, data were collected in the form of an inventory of livestock and implements owned by the households on the date of enquiry. It can be seen from Tables (32) to (40) that on an average a hundred households owned 239 cattle out of which 109 were males, 75 females and 55 young stock. The corresponding figures for buffaloes were 13 males, 32 females and 23 young stock with a total of 68 per hundred households. Households possessing one individually operated holding reported as owning 322 cattle and 89 buffaloes.

3.16.5 The number of wooden ploughs, iron ploughs and carts owned per hundred households were estimated at 69, 4 and 20 respectively. The use of tractors was very rare as four out of ten thousand household were reported as owning tractors each, (vide Table 44 in Appendix I). Although the data on the number and type of implements used actually in the agricultural holdings is not available from this survey, the above figures go to show that the Indian agriculture is as yet not very alive to the modernisation of the equipments.

3.17 A survey on land holdings was carried out in the eighth round of NSS. The distribution of agricultural holdings as was obtained from that round has been compared in Table (3.5) with the distribution obtained by pooling the total samples of the 16th round and 17th round surveys.

3.17.1 It will be observed that the percentage of holdings of size less than half an acre has decreased in the period 1959-61 when compared to 1953-54 figures. The percentage of holdings between 2.50 and 5.00 acres have increased substantially during the period. The area claimed by 1.53 per cent of holdings of size 50 acres or more was as much as 17 per cent of total area in 1953-54 while the corresponding percentages for the 1959-61 period were 1 per cent holdings and 12 per cent of total area. This difference of 5 per cent area belonging to the uppermost classes between the two periods under study seems to have been distributed over other size classes of holdings. This indicates that although there have been some attempts at removing the unevenness of the distribution, the results have been far from satisfactory—the overall picture has not changed to an appreciable extent.

3.18 While the above paragraphs are intended as a summary of important results revealed by the survey, this summary is apt to be of limited significance, as a detailed analysis of the estimates can only be undertaken when they are given by size of holdings. The tables in Appendix I serve this purpose. Moreover, the estimates in Appendix I are given for each of the three interpenetrating sub-samples, thereby providing a margin of uncertainty of the estimates.

TABLE (3.5) : *Cumulative percentage distribution of number of agricultural holdings and area operated by them by size of holdings : 8th and 16th & 17th Rounds pooled, N. S. S.*

Reference period : 8th round—major crop season 1953-54
16th round—agricultural year 1959-60
17th round—agricultural year 1960-61
