THE NATIONAL SAMPLE SURVEY

TWENTYSEVENTH ROUND : OCTOBER 1972 - SEPTEMBER 1973  
PER CAPITA PER DIEM INTAKE OF CALORIE, PROTEIN AND FAT

Section One

INTRODUCTION

1.1 The data on level of nutrition, based on the NSS twenty sixth round household consumer expenditure <sup>survey,</sup> conducted during July 1971 to June 1972 were published in NSS report number 238, separately for the rural and urban areas of each state/union territory of India. With the availability of tabulated results of the NSS 27th round (October 1972 - September 1973) consumer expenditure data, collected from a considerably larger number of sample households viz., 72270 in rural India and 52820 in urban India, the desirability of obtaining comparable estimates on the intake of nutrients from the NSS 27th round survey data became obvious.

1.2 Content : The present report provides results on energy, protein and fat consumed per capita per diem for the rural and urban areas of all the states at regional level, based on the data collected in the household survey on consumer expenditure of the NSS twenty seventh round. In this survey, data relating to expenditure incurred by the sample households on all items which were used for domestic consumption during the period of 30 days preceding the date of survey, were collected in the different blocks of the household schedule.

1.3 Geographical Coverage : The geographical coverage of the survey was extended over the whole of rural and urban areas of India excepting : Ladakh district of Jammu & Kashmir, rural areas of Pal and Samri tehsils of district Surguja and Bijapur, Dantewara, Konta and Narayanpur tehsils of district Bastar of Madhya Pradesh, Rajura, Sironcha and Godh-Chiroli tehsils of district Chanda and Melghat tehsil of district Amaravati of Maharashtra, rural areas of Nagaland, disturbed villages of Tripura, rural areas of the Union Territory and Chandigarh the Union Territories of Arunachal Pradesh, Andaman and Nicobar Islands, Mizoram, Laccadive, Minicoy and Amindivi Islands and Dadra and Nagar Haveli.

1.4 Sample Size : Information was collected by interviewing one of the members (usually the head) of the sample households. Altogether 72270 sample households from 8,626 sample villages and 52,820 sample households from 4,772 urban blocks were surveyed. The sample design and estimation procedure has been presented in Appendix I.

1.5 The computational procedure followed for arriving at the results presented in the tables is described below :

The detailed itemwise average quantity of food consumed per capita per month were converted into equivalent measures of (a) calorie (b) protein and (c) fat, for each per capita average monthly expenditure group, separately for the rural and urban areas of each state at the regional level<sup>by</sup> using the appropriate factors provided in the food composition tables. Dividing the total calorie intake, protein intake and fat intake thus obtained by 30, an estimate of per capita per diem average calorie, protein and fat intake for each expenditure group were calculated and are shown in the tables presented in Appendix II.

1.6 The following system has been adopted in numbering the tables : The left hand number refers to the individual State/Union Territory which are first arranged in alphabetic order of their respective names and are assigned serial numbers in that order and the digits following the decimal point, stand for the region number within the corresponding state.

## Section Two

### CONCEPTS AND DEFINITIONS

2.1 Some of the basic concepts and definitions used in the NSS 27th round consumer expenditure survey are noted below.

2.2 Household : A household is a group of persons normally living together and taking food from a common kitchen. A member of a boarding house or a hotel boarder (with his dependents or guests) forms a separate household. Households maintained and fed directly by government such as those in prisons, police quarters, cantonments, hospitals, relief camps are however, excluded from the scope of the enquiry.

2.3 Household member : Any person who usually lives and takes principal meal with the household is considered to be a member of the household. Such a person may be the head of the household or a relative or a protegee of the head or an employee of the household.

2.4 Household size : The number of members (as defined above) in a household constitutes the household size.

2.5 Cash purchase : This refers to all cash purchase except those made for enterprise purposes of the household during the reference period. Only such purchases as are made for non productive domestic consumption are considered for this purpose.

2.6 Home grown stock : Home grown stock means commodities produced at home. This includes produce from leased in as well as from leased out land, produce from kitchen garden and livestock products and produce from household industries. Produce brought from village home is also included in this. The value of home grown stock is imputed at ex-farm price or ex-factory rate which excluded any transport or distributive cost or middleman's profit or other trade margins.

2.7 Household Consumer Expenditure : Consumer expenditure of a household comprises of all expenditures incurred by the household during a reporting period of 30 days preceding the date of survey exclusively towards its non productive domestic consumption. Thus all expenses towards the entrepreneurial activities of the household are excluded. Transfer payments in kind like loans advanced, charities, gifts and other payments in kind, if any, are not considered as consumer expenditure. But any consumption out of transfer receipts in kind like borrowings, gifts, charities, perquisites received by the household, free collections and other receipts in kind, if any, is considered for determining total consumption of the household.

2.8 Household consumption : Value and quantity of food and non-food items consumed by the household during a period of 30 days preceding the date of enquiry were collected in the survey. Quantity consumed by cattle etc. were not to be included under domestic consumption. While quantity consumed out of transfer receipt was included, any such quantity disposed as gift or as transfer payment was excluded for deriving the quantity of domestic consumption. Thus the total consumption of goods is related to the actual consumption made by the normally resident members (excluding temporary stay aways) and guests. This also included consumption of food articles in ceremonies performed in the household during the reference period.

2.9 Calorie : It is a unit for measuring energy. The calorie unit of measurement of nutrients in food is 1000 times the conventional 'calorie' unit of energy. Hence in some studies, the unit of nutrient has been expressed as

'K-cal' (i.e. Kilo calories or 1000 calories) or simply 'Cal.'. Food items like cereals, sugar, potato etc. are normally the major source of supply of energy in a human body. Weight per weight, these food items contain larger amount of carbohydrate which is converted into glucose within the body. The glucose thus produced is burnt and the resulting heat is the energy source. Similarly most of the food consumed is transformed within the body and is converted to produce some amount of energy.

2.10 Protein : Protein is taken as the foundation of human diet. It is an important constituent of the diet as it is necessary for the growth and integrity of living tissues. During the process of digestion, proteins are broken down into amino-acids. They are not store in the body. Shortage of protein requirement causes malnutrition. Protein requirement is greater during periods of growth in children and under stress conditions such as pregnancy and lactation.

It is derived mainly from pulses and nuts, soyabean, milk, egg, fish and meat. Animal proteins i.e. those derived from milk, egg, fish and meat, are of higher biological value than vegetable proteins. It is usually expressed in grms. per 100 grms. of edible portion of a food.

2.11 Fat : Fat is a concentrated source of energy and is a necessary nutrient in the diet. It is mainly derived from ghee, butter and edible oils.

### Section Three

#### SUMMARY OF RESULTS

3.1 Compared to the minimum requirement of 2200 K-cals per capita per day which is equivalent to 2750 K-cals per consumer unit per day, the average calorie intake for the population was found to be slightly higher in the rural sector and lower in the urban sector, at the all India level. It has been observed that on an average, in our country, one person is equivalent to 0.8 consumer unit<sup>1/</sup>. The said nutritional norm, based on the recommendations given in the report of a joint FAO/WHO ad-hoc expert committee<sup>2/</sup> (1973), is in agreement with the recommendations made by the Indian experts<sup>3/</sup>.

3.2 Average level of calorie intake in rural areas of states : At the state level, per capita per diem intake of calorie was observed to be above the minimum requirement in rural areas of Punjab(3493), Haryana(3215), Jammu & Kashmir(3151), Himachal Pradesh(2954), Delhi(2913), Rajasthan(2730), Uttar Pradesh

(2575), Madhya Pradesh(2423), Manipur(2310), Bihar(2225) and Karnataka(2202). On the other hand, the same was reported to be much below the minimum requirement in rural areas of Kerala(1559), Maharashtra(1895), West Bengal(1921), Tamil Nadu (1955), Goa, Daman & Diu(1973), Orissa(1995), Assam(2074), Meghalaya(2088) and Andhra Pradesh(2103). The calorie intake was found to be slightly lower than the minimum requirement in the rural areas of Gujarat(2142), Tripura(2141) and Pondicherry( 150). Thus the rural areas of most of the eastern and southern states of India reported to have the level of calorie consumption well below the minimum requirement which is in conformity with the result of 26th round (July 1971 - June 1972)<sup>4/</sup>.

### 3.3 Average level of calorie intake in urban areas of states :

The pattern was different in urban areas. The per capita per diem intake of calorie at the state level was above the minimum requirement in Himachal Pradesh (2961), Punjab (2783), Meghalaya (2598), Tripura (2511), Jammu & Kashmir (2467), Manipur (2456), Haryana (2404), Rajasthan (2357), Orissa (2276) and Madhya Pradesh (2229). On the other hand, the same was much below the minimum requirement in Kerala (1723), Tamil Nadu (1841), Karnataka (1925), Maharashtra (1971), Pondicherry (1998), West Bengal (2080) and Goa, Daman & Diu (2119). The calorie intake was slightly lower than the minimum requirement in Assam (2135), Andhra Pradesh (2143), Delhi (2157), Uttar Pradesh (2161), Bihar (2167), and Gujarat (2172).

A comparison of the level of intake of calorie for 26th round and 27th round data indicate that the level of intake in most of the States has remained unchanged during a period of one year excepting <sup>/in</sup> Himachal Pradesh, Haryana, Jammu & Kashmir, Meghalaya, Punjab and Tripura where the level of intake has improved.

- 1/ Sen Gupta, S and Joshi, P.D (1978) : Consumption of Cereals and Energy Content of food consumed, Sarveksana, The Journal of N.S.S.O., Vol.2 No.1
  - 2/ FAO/WHO Adhoc Expert Committee(1973) : "Energy and Protein Requirement".
  - 3/ Gopalan, C and Narsing Rao, B.S. (1977) : "Dietary Allowances for Indians", Ind. Jour. Med. Res. Special Report No. 60.
  - 4/ Government of India, National Sample Survey Organisation Department of Statistics, Ministry of Planning (1976) : "Calorie and Protein Values of Food Items Consumed per Diem per Consumer Unit", NSS No.238. Volumes I and II.

3.4 Comparison of the level of calorie intake between rural and urban areas of states : Sectoral differences in respect of calorie intake has also been observed. While no marked variation is apparent between the rural and urban areas of a few states viz. Andhra, Assam, Bihar, Gujarat, Himachal Pradesh, Kerala, Maharashtra, Manipur, Tamil Nadu, Goa, Daman & Diu and Pondicherry, the level of intake in the rural areas of Haryana, Punjab, Rajasthan, Jammu & Kashmir, Uttar Pradesh, Delhi, Madhya Pradesh and Karnataka were considerably higher than the corresponding level in the urban areas. Similarly states viz. Meghalaya, Tripura, Orissa and West Bengal with low calorie intake in rural areas recorded higher intake in urban areas.

3.5 Calorie intake at higher per-capita expenditure levels : Calorie intake at the top per capita expenditure class is found to be conspicuously high in some regions. There is a possibility of food served to guests during ceremonies or to visitors and also food served to employees, getting mixed up and reported as domestic consumption of a household. The high rate of calorie intake reported at some places might be due to this. Some further probing is however needed to explain the observed high rate of intake of energy.

3.6 Intake of protein : The all India (average) per capita consumption of protein has been estimated to be 62.7 grms. per day for the rural sector and 56.7 grms. per day for the urban sector which is more than the recommended level. It is seen from tables S.1 and S.2 that the average per capita per diem intake of protein is in general adequate at the regional and sectoral level except for rural sector of Kerala. Further the pattern of protein consumption in general for the rural and urban areas of different states at the regional level corresponds to the pattern of calorie consumption. The quantitative adequacy of protein intake may be considered only when the calorie intake is adequate.

3.7 Intake of fat : A comparison of tables (S.1) and (S.2) in respect of fat intake reveals that the level of fat intake is higher in urban areas of different states except in Haryana & Jammu & Kashmir compared to their corresponding <sup>rural</sup> /counter parts. The all-India average per capita consumption of fat has been estimated at 24.5 grms. per day for the rural sector and 36.7 grms. per day for the urban sector. It appears that in view of consumption of vegetable oils, the fat requirement, at least in respect of providing necessary amounts of essential fatty acids, is met on an average.

3.8 Proportion of expenditure on food: It is found that the percentage of food expenditure to total expenditure in rural areas of different states is higher compared to their corresponding urban counterparts. At the all-India level, the expenditure on food works out to be 72.70% and 64.32% for the rural and urban sectors respectively. There is no marked inter regional variation in respect of proportion of expenditure on food.

3.9 Level of intake of nutrients in big cities : Table (S.3) shows that there is no marked variation in regard to the level of per capita energy and protein intake between the four big cities - Bombay, Calcutta, Delhi and Madras but the level of per capita fat intake in Delhi is highest (55.2 gms. per day). The per capita intake of calorie and protein in Madras is also less compared to the other three big cities - Bombay, Calcutta and Delhi, which may be associated with the differences in consumption habits.

sc/

TABLE(S.1) : AVERAGE PER CAPITA ENERGY (K-CAL), PROTEIN (GM) AND FAT (GM) INTAKE PER DIEM, MONTHLY PER CAPITA EXPENDITURE AND PERCENTAGE OF EXPENDITURE ON FOOD TO TOTAL EXPENDITURE BY REGIONS FOR THE RURAL AREAS OF DIFFERENT STATES : N.S.S. 27TH ROUND (OCTOBER 1972 - SEPTEMBER 1973)

## APPENDIX I

### SAMPLE DESIGN AND ESTIMATION PROCEDURE

- 1.1 Sample design : The general sample design was stratified with two-stage selection within each stratum. The first-stage units were villages in rural areas and blocks in urban areas; the second-stage units were households in both rural and urban areas. The sample design was self-weighting at the region and sub-stratum level in rural areas. The sample villages and blocks were usually selected in the form of two independent and inter-penetrating sub-samples.
- 1.2 Sample size (Central Sample) : In the central sample there were 9088 villages in rural areas and 1832 blocks in urban areas.
- 1.3 Work Programme : The survey period of 12 months had been divided into 4 sub-rounds of 3 months each.
  - (i) Sample Design (Rural)
- 1.4 Sampling Frame : The frame used for selection was the list of villages as per 1971 population census.
- 1.5 Stratification : The country had been divided into 66 agricultural regions by grouping, within each state of Union Territory, districts having similar population, density and crop pattern. Then within each region, strata had been formed by grouping tehsils which were (i) contiguous, (ii) having similar crop pattern, population density and altitude and (iii) having good transport and communication facilities amongst them. The rural population was about the same for each stratum within a region. The number of strata formed within a state/Union Territory was given by the number of sample villages allocated to it divided by 24 except in Uttar Pradesh where each district was a stratum. The total number of rural strata was 392.

- 1.6 Allocation (Central Sample): The all India sample size of 9088 villages had been allocated to the states on a joint consideration of their rural population, area under cereal crops and available investigator strength. This was modified to (i) ensure a minimum of 360 villages in a state excepting some smaller states and the Union Territories, (ii) take account of state-wise variation in work-load and number of investigators, and (iii) make the sample size a multiple of 24 in order to facilitate selection of 2 sub-samples of 12 villages.
- 1.7 Selection of villages : Two independent sub-samples of 24 villages each were selected circular systematically with equal probability in each stratum, after arranging the tehsil of the stratum in a serpentine order. In each sub-sample, the villages with odd order of selection formed the Central Sample and the rest formed the State Sample. Thus generally, each sub-sample of a rural stratum contained 12 sample villages. But a sub-sample had only 8 villages in Delhi, 3 villages in central sample of Goa, Daman & Diu. And in Uttar Pradesh, the sub-sample size varied from stratum to stratum and also between central and state samples.
- 1.8 Selection of households : All households in a sample village/hamlet group were divided into three sub-strata on the basis of their means of livelihood as follows : (1) self-employed in non-agriculture, (2) rural labour and (3) others. On an average, 12 sample households were selected in a sample village (2, 5 and 5 respectively). Sampling of households was done linear systematically and independently from each sub-stratum using the interval and random start specified for the purpose so as to make the design self-weighting at the region level for each sub-stratum.

(ii) Sample Design (urban)

- 1.9 Sampling Frame : The list of NSS Urban Frame Survey (UFS) blocks supplemented by the list of 1971 census blocks (1961 census blocks in Tamil Nadu and West Bengal) had been used as the sampling frame.
- 1.10 Stratification : In each state/Union Territory, towns with 1971 census population less than 50,000 formed stratum 1 and the remaining towns and cities formed stratum 2 except the four big cities viz., Bombay, Calcutta, Delhi and Madras. Each one of them formed stratum 3 of its respective state. The total number of urban strata in all-India was 50.
- 1.11 Allocation (Central Sample) : The all-India sample size of 4832 blocks had been allocated to the states in proportion to their 1961 census urban population. The allocations had been modified (i) to ensure a minimum of 144 sample blocks in a state excepting some smaller states and Union Territories, (ii) to take account of state wise variation of work-load and number of investigators and (iii) to make the allocations multiples of 8 in order to facilitate having 2 sub-samples and 4 sub-rounds. Sample size for a state was allocated to the strata in it in proportion to their total urban population. Final stratum allocations also were made multiples of 8.
- 1.12 Selection of blocks : In each stratum, blocks had been selected circular systematically with probability proportional to size (PPS), the size of a block being taken as its population rounded off to the next multiple of 1000. Generally, the blocks had been selected in the form of two independent and interpenetrating sub-samples of equal size; within each sub-sample the central sample and the state sample were formed as for sample villages.
- 1.13 Selection of households : All households of a sample block/sub-block were divided into two sub-strata : (1) self-employed and (2) not self-employed. Further, the households of sub-stratum 1 were arranged in two classes viz., (a) self-employed in manufacture, and (b) self-employed in other activities. Then from each sub-stratum households were sampled linear systematically using the interval and random start specified in the sample list. The average sample size for a block was 12 households - 6 from each sub-stratum.

1.14 Estimation Procedure :

Notations

- s : subscript for s<sup>th</sup> stratum in a state
- t : subscript for t<sup>th</sup> sub-stratum within a sample village/block
- i : subscript for i<sup>th</sup> sample village/block/selected part of village or block
- j : subscript for j<sup>th</sup> sample household
- k : number of strata in the state
- n<sub>s</sub> : number of selected villages/blocks in a sub-sample of the s<sup>th</sup> rural/urban stratum for the whole round
- h : number of households selected for the enquiry
- y : value of the characteristic

Y, the estimate of the state total for the characteristic y in consumer expenditure schedule from a sub-sample for the whole round, is given by for rural areas,

$$Y = \sum_{t=1}^3 \sum_{s=1}^k M_{st} \sum_{i=1}^{n_s} \sum_{j=1}^{h_{sit}} y_{sitj}$$

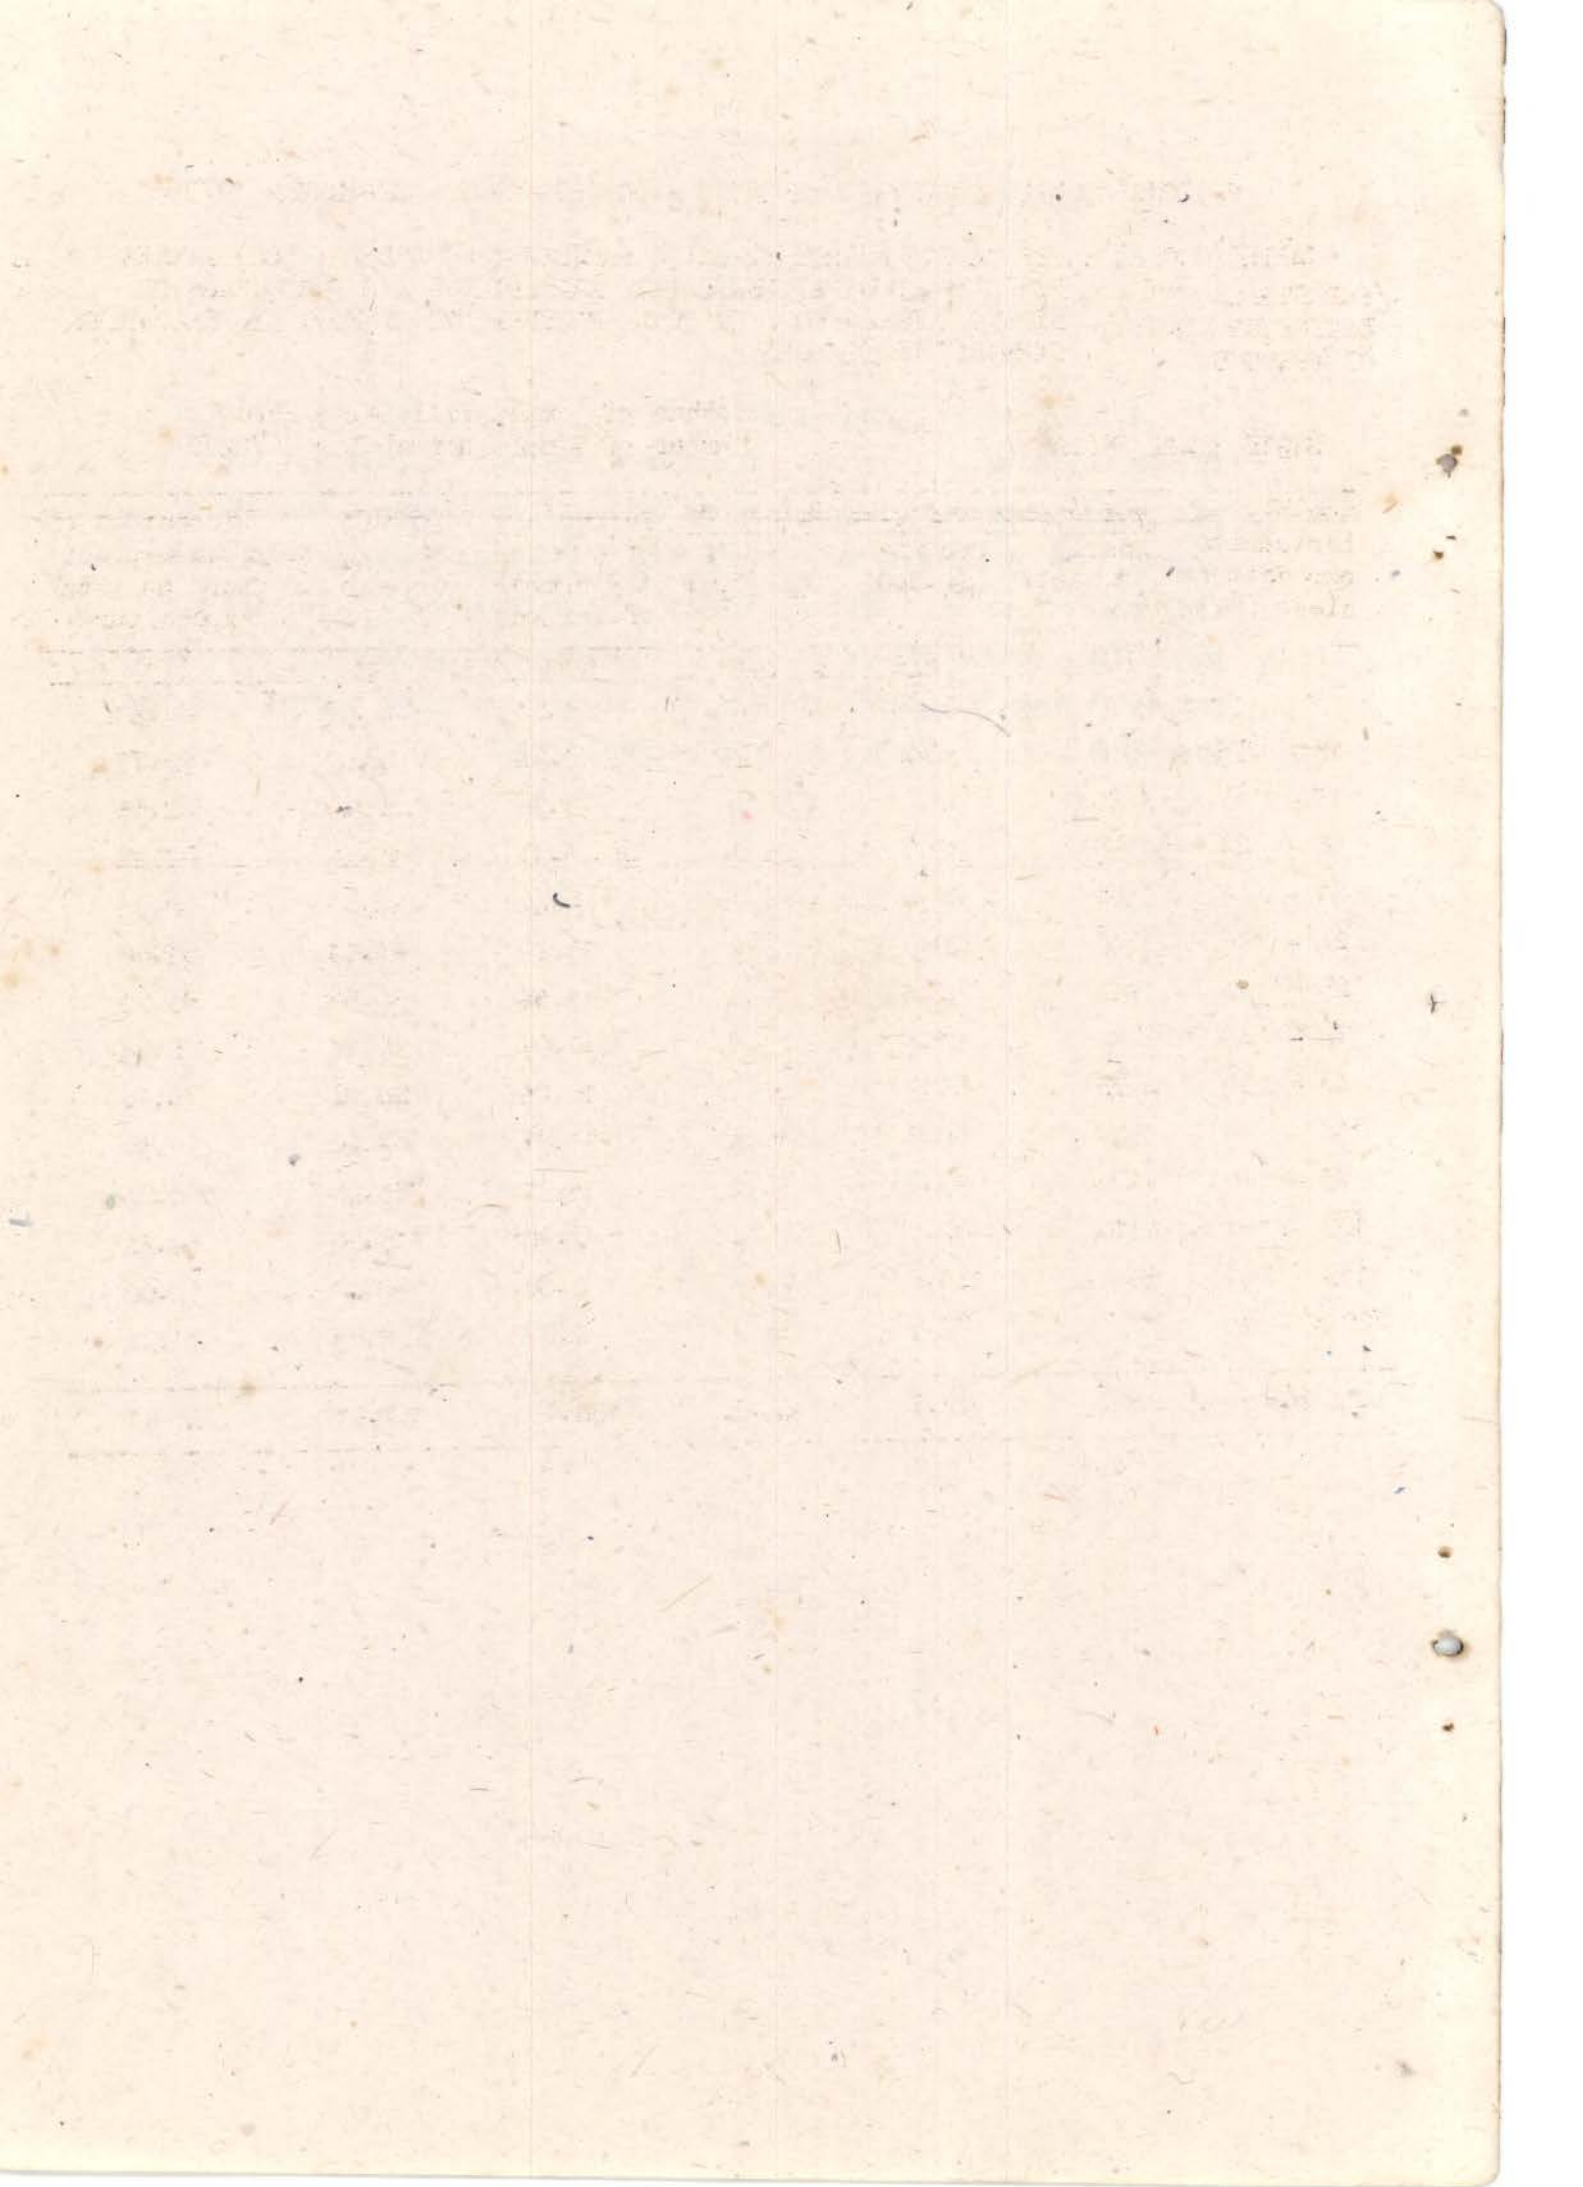

Where  $M_{st}$  is the constant multiplier for the s<sup>th</sup> stratum and t<sup>th</sup> sub-stratum. It may be noted that  $M_{st}$  is same for all strata within a region. For urban areas Y is given by,

$$Y = \sum_{t=1}^2 M_t \sum_{s=1}^k \sum_{i=1}^{n_s} \sum_{j=1}^{h_{sit}} y_{sitj}$$

Where  $M_t$  is the state-wise constant multiplier for the t<sup>th</sup> sub-stratum.

## APPENDIX II

Tables on per capita energy (K-cal), Protein (gm) and fat (gm) intake per diem, Percentage of estimated number of persons, monthly per capita expenditure and percentage of expenditure on food to total expenditure by monthly per capita expenditure classes for the rural and urban areas of different states at the regional level, of four big cities and of all-India. Results derived from Consumer Expenditure Survey (schedule 1.0) of the NSS 27th round conducted during the one year period from October 1972 to September 1973.

NATIONAL SAMPLE SURVEY, 27TH ROUND : OCTOBER 1972 - SEPTEMBER 1973
