M R R A T A

1. Page 3 :

- (i) Put a star-mark on the last word 'sex' of the top heading
- (ii) Add the following foot-note at the bottom of the page
"* Energy and Protein requirements, FAO/WHO Ad-hoc Experts Committee (1973)".

2. Page 4 :

- (i) Put a star-mark on the last word 'conversion' of the last sentence.
- (ii) Add the following foot-note at the bottom of the page
* The conversion factors were taken from "Dietary Allowances for Indians", Indian Journal of Medical Research, Special Report Series, No. 60 by C. Gopalan and B.S. Narasing Rao (1977).

3. In the Hindi version of the title of the report on the cover page and on next page, उत्ति may be replaced by उपभोग इकाई

4. In the title of the report on contents page and page 1, CALORIE PROTEIN AND FAT may be replaced by NUTRIENTS.

5. In Tables 1.0K to 1.26K (pages 41 to 425) and Tables 1.0U to 1.26U (pages 451 to 477) in the sub-heading of cols. 2, 3 and 4, the following changes may be made :

- (i) Calorie may be replaced by Cal. (in col. 2)
- (ii) Protein may be replaced by protein (gm). (in col. 3)
- (iii) Fat may be replaced by fat (gm). (in col. 4)

6. In page 81, under col. 5 and against row no. 7, 30.5 may be replaced by 80.5 .

THE NATIONAL SAMPLE SURVEY
THIRTY SECOND ROUND : JULY 1977-JUNE 1978

NUMBER 329
PER CONSUMER UNIT PER DIEM INTAKE OF CALORIE AND PROTEIN

SECTION ONE

INTRODUCTION

- 1.1 The results on average intake of essential nutrients presented in this report were derived from the data on food consumption collected through the consumer Expenditure Enquiry of the National Sample Survey(NSS), thirty second round, conducted during July 1977 to June 1978.
- 1.2 Survey Period : The field work of the consumer expenditure survey started in July 1977 and continued upto June 1978, covering a period of one complete year.
- 1.3 Geographical Coverage : The geographical coverage of the survey was the intire Indian Union excluding Sikkim, Ladakh district of Jammu & Kashmir, rural areas of Pal and Samri tehsils of district Surguja and Bijapur, Dantwara, Konta and Narayanpur tehsils of district Bastar of Madhya Pradesh, Rajane, Sironeha and Gadh-chiroli tehsils of district Chandrapur and Melghat of district Amravati of Maharashtra; rural areas of Chandigarh, Mizoram and Nagaland; Andaman and Nicobar Islands; LakshawEEP; Dadra and Nagar Haveli. The survey in North Eastern Region covered Arunachal Pradesh, two hill districts(Mikir hills and Cachar hills) of Assam, Manipur, Meghalaya, Mizoram, Tripura and urban areas of Nagaland.
- 1.4 Sample Size : Information was collected by interviewing the members (usually the head of the household) of the sample household. Altogether 99766 sample households selected from 8216 sample villages in rural areas and 58162 sample households from 4871 sample blocks in the urban areas were surveyed.

SECTION - TWO

CONCEPTS AND DEFINITIONS

- 2.1 Some of the basic concepts and definitions used in the NSS surveys on consumer expenditure are noted below.:
- 2.2 Household : A household is a group of persons normally living together and taking food from a common kitchen. A boarding house, a hotel or a hostel is treated as a cluster of households, where each individual boarder (with his dependants and guests) forms a separate household. Inmates of jails, police quarters, cantonments, hospitals, asylums, relief camps are, however, excluded from the scope of this survey.
- 2.3 Household member : Any person who is a normal resident of the household is considered to be a member of the household.
- 2.4 Household size : The total number of members (as defined above) in a household is considered to be the size of the household.
- 2.5 Household consumer expenditure : Consumer expenditure comprises all expenditures incurred by the household, exclusively on domestic account, including consumption out of ^{home-}grown produce or transfer receipts like gift, loan etc. The expenditure on household enterprise is excluded from consumer expenditure, while consumption out of transfer receipts is included, transfer payments of all kinds (loans, gifts, charities, monetary as well as in kind like grain loan etc.) are excluded. Thus the total consumption of food related to the actual consumption made by the normally resident members (excluding temporary stay-aways) and guests. This also included consumption of food articles in ceremonies performed in the household during the reference period.
- 2.6 Consumer Unit : The consumer unit number for a person of a sex-age group is an index number representing his/her requirement of energy in relation to that for the reference man. A man belonging to the age group 20-39 is considered as the reference man and his energy requirement is one consumer unit.

Consumer unit by age (in years) and sex

age in completed years

sex	under 1	1-3	4-6	7-9	10-12	13-15	16-19	20-39	40-49	50- 59	60- 69	70 & above
male	0.43	0.54	0.72	0.87	1.03	0.97	1.02	1.00	0.95	0.90	0.80	0.70
female	0.43	0.54	0.72	0.87	0.93	0.80	0.75	0.71	0.68	0.64	0.51	0.50

- 2.7 Calorie : It is a unit for measuring energy. The calorie unit of measurement of nutrients in food is 1000 times the conventional 'Calorie' unit of energy. Hence in some studies the unit of nutrient has been expressed as Kcal (i.e. Kilo Calories or 1000 calories) or simply 'Cal'(Calorie). Food items like cereals, sugar, potato etc. are converted into glucose which is burnt and is normally the major source of supply of energy in a human body. Similarly most of the food consumed is convertible into energy equivalent.
- 2.8 Protien : It is another nutrient derived mainly from meat, egg, fish, pulse and milk. It is usually expressed as grammes per 100 grammes of edible portion of a food item.
- 2.9 Fat : Fat is a concentrated source of energy and is a necessary nutrient in the diet. It is mainly derived from ghee, butter, and edible oils.

SECTION THREE

EXPLANATORY NOTES ON TABLES

- 3.1 Tables have been prepared separately for the rural and urban areas of each state and union territory of India. The households are classified by percapita monthly expenditure group and the amount of calorie intake per diem per consumer unit group. For per capita monthly expenditure group of households, the table shows-
- i) per consumer unit per diem intake of calorie, protien and fat;
 - ii) percentage of total intake of calorie from cereals, and meat, fish & egg;
 - iii) percentage of total intake of protien from cereals and meat, fish & egg; and
 - iv) average monthly percapita expenditure in rupees. For Calorie intake per diem per consumer unit group of households, the table shows -
- i) number of sample households;
 - ii) average household size;
 - iii) number of consumer unit per household; and
 - iv) percentage of calorie intake for five broad food groups.

3.2 For the classificatory items the following sets of groups were used in the tabulation :

A. Percapita monthly consumer expenditure (in rupees) group

(1) 00 - 10 (2) 10-15 (3) 15-20 (4) 20-30 (5) 30-35
(6) 35-40 (7) 40-50 (8) 50-60 (9) 60-70 (10) 70-80 (11) 80-100
(12) 100-150 (13) 150-200 and (14) 200 & above for the rural areas. For urban areas the last three groups are (13) 150-200 (14) 200-300 and (15) 300 & above.

[00-10 means 00-9.99; 10-15 means 10-14.99 and so on]

B. Calorie intake per diem per consumer unit group

(1) upto 1500 (2) 1500-1700 (3) 1701-1900 (4) 1901-2100
(5) 2101-2300 (6) 2301-2500 (7) 2501-2700 (8) 2701-3000
(9) 3001-3500 (10) 3501-4000 (11) 4001 & above.

C. Food groups

- I cereals, potato, sugar, Jaggery and cereal substitutes;
- II pulses, nuts and seeds;
- III milk and milk products; meat, egg and fish;
- IV edible oils;
- V fruits, vegetables, spices and prepared food.

3.3 Derivation of results : The basic information needed for deriving the results presented in this report were taken from the consumer expenditure schedule of the NSS, 32nd round (July 1977 - June 1978). For this purpose, the households were classified under two different characteristics, (i) level of percapita monthly expenditure in which the total consumer expenditure of a household during last 30 days preceding the date of enquiry was divided by its household size, and (ii) level of calorie intake per diem per consumer unit. To derive the later, the quantity estimate for each of the item of food consumed by a sample household was converted into its equivalent number of calories using the appropriate factor of conversion. Aggregating the total calories thus estimated for all the food items consumed by the household

during the 30 days preceding the date of enquiry, the required level of calorie intake per diem per consumer unit was derived by dividing the aggregate by the product of 30 and the number of consumer units in the household. The per diem per consumer unit intake of protien was calculated in a similar way.

3.4 For conveniences of reference, the table numbers have been coded-the digit to the left of the decimal point refers to the nature of information and digits to the right refer to the state/union territory, followed by R for rural tables and U for urban tables.

The code numbers assigned to the state/union territory are as follows :-

- | | |
|---------------------|-----------------------|
| 0. all India | 14. Nagaland |
| 1. Andhra Pradesh | 15. Orissa |
| 2. Assam | 16. Punjab |
| 3. Bihar | 17. Rajasthan |
| 4. Gujarat | 18. Tamil Nadu |
| 5. Haryana | 19. Tripura |
| 6. Himachal Pradesh | 20. Uttar Pradesh |
| 7. Jammu & Kashmir | 21. West Bengal |
| 8. Karnataka | 22. Arunachal Pradesh |
| 9. Kerala | 23. Chandigarh |
| 10. Madhya Pradesh | 24. Delhi |
| 11. Maharashtra | 25. Goa, Daman & Diu |
| 12. Manipur | 26. Pondicherry |
| 13. Meghalaya | |

SECTION FOUR

SUMMARY OF FINDINGS

4.1 In the present round, the average calorie intake per consumer unit per diem in the country as a whole is found to be (Table 1) 2978 in the rural area and 2924 in the urban areas which are fairly higher than the minimum requirement of 2700 calories for healthy living. In the 26th round (July 1971 - June 1972) the average intake for the rural and urban areas was 2724 and 2699 which are just around the minimum requirement.

4.2 Some of the states where the average calorie intake was considerably high were Rajasthan (3665), Punjab (3604), Haryana (3485), Jammu & Kashmir (3448) and Uttar Pradesh (3264) in the rural areas and Haryana (4942), Chandigarh (4377), Goa, Daman & Diu (4372), Arunachal Pradesh (4260) and Tripura (3847) in the urban areas. On the other hand Tamil Nadu (2596), Pondicherry (2605), Tripura (2725), Kerala & Meghalaya (2634 & 2635) and Orissa in the rural sector and Kerala (2561), Maharashtra (2607), Gujarat (2720), Uttar Pradesh (2730), and Delhi (2733) in the urban sector were found to have lower intake of energy.

4.3 It was generally observed that in the lower per capita expenditure groups the levels of calorie intake were too low. In the top expenditure class, on the other hand, the calorie intake level was too high in some of the states. It may be observed in this context that the meals served to employees by an employer, by convention for convenience of data collection, were included in the consumption of employers' households and were not taken into account while collecting information from the employers' households. The observed distortion at both the extremities might be the effect of the data collection procedure.

Table (1) : Average calorie intake per consumer unit per diem for the rural and urban areas of each state and union territory of India.

† The survey results available in terms of percapita intake have been converted into per consumer unit intake.

SECTION FIVE

A broad outline of the Sampling Design and
Estimation Procedure

5.1 Broad design : The sampling design is a stratified two-stage one : the first-stage units are villages in the rural sector and blocks in the urban sector, and the second stage units are households in both the sectors.

5.2 Formation of strata : For the purpose of stratification, the country was first divided into 73 agro-economic regions by grouping contiguous districts of similar agricultural profile- the number of regions in a state/union territory varying from one to five. "Basic strata" were formed within regions based on districts as follows. Each district with less than 1.5 million 1971 census rural population forms one basic stratum by itself except in Gujarat and Arunachal Pradesh where some district with less than 1.5 million population have been divided into two or more basic strata. A district with more than 1.5 million 1971 census rural population has been divided into a number of basic strata, depending on its rural population, by grouping contiguous tehsils, homogeneous as far as possible with respect to rural population density and crop pattern. Basic strata so formed have been treated as the strata for sampling for both rural and urban sectors. In the urban sector, however, some of the basic strata having very small urban population have been merged together to form the ultimate urban strata. Total number of rural and urban strata are 516 and 386 respectively.

5.3 Allocation : The all India sample of 8820 villages and 4940 urban blocks were allocated to the states union territories considering the field strength and rural and urban populations of each. Within each state and union territory these have been further allocated to the rural and urban strata in proportion to their 1971 census rural and urban population

respectively. The final allocations of strata have been so adjusted as to make them a multiple of 4 at the stratum level and a multiple of 8 at the region level.

5.4 Sampling of villages : In each rural basic stratum the allocated number of villages have been selected with probability proportional to population and with replacement. The frame used was the 1971 census list of villages. This procedure however, was not followed for the north-eastern region.

5.5 Sampling of villages - N E region : In the North-Eastern region, clusters of villages formed around some 'nucleus' villages were selected for survey. These nucleus villages were selected systematically with equal probability. A cluster consisted of 4 villages, in general, but did not exceed 6 in any case. In Manipur (plains) stratum, clusters were not formed. All the allocated villages were selected in one step systematically with equal probability.

5.6 Sampling of urban blocks : In each urban stratum, the allocated number of sample blocks were selected with probability proportional to size (a measure of population) and with replacement. The same procedure was followed for the North-Eastern region also. The frame used was Urban Frame Survey (UFS) blocks in cities and towns where UFS had been done and 1971 census blocks elsewhere.

5.7 Sampling of households (rural) : All the households of a sample village were arranged into the following means of livelihood classes - (1) self-employed in non-agriculture, (2) rural labour and (3) others. A sample of 12 households was selected circular systematically from the arranged frame. In the North-Eastern region, if a cluster consisted of L villages then $24/L$ households were selected in the above manner from each village of that cluster.

5.8 Sampling of households (urban) : In a sample block, the sampling frame was prepared by arranging the households into 4 classes on the basis of their nature of employment (self-employed, not self-employed) and their per capita expenditure level (less or greater than the pre-assigned per capita expenditure for the state). As in the case of villages, 12 households were selected circular systematically from this frame.

5.9 Survey period and sub-rounds : The survey was started in July 1977 and completed in June 1978. The entire survey period of one year was divided into 4 sub-rounds each of three months' duration, coinciding approximately with the 4 agricultural seasons. The 4 sub-round periods are :

Sub-round	1	:	July	to	September	1977;
Sub-round	2	:	October	to	December	1977;
Sub-round	3	:	January	to	March	1978;
Sub-round	4	:	April	to	June	1978.

The sample villages & blocks were distributed over the 4 sub-rounds in equal numbers so as to provide equally valid estimates for each of the sub-round separately.

5.10 Estimation Procedure : The estimate of the aggregate of any characteristic y for a state/union territory was obtained as follows :

$$Y = \sum_{r=1}^R M_r \sum_{i=1}^{h_r} Y_{ri}$$

where $M_r = \frac{P_r^*}{p_r}$ where P_r is the projected rural/urban population of r th region and p_r is the number of sample persons in the rural/urban area of that region (i.e., P_r is the sum of the household sizes of all the surveyed households).

R = number of regions in the state

h_r = number of surveyed households in r th region

y_{ri} = value of y for the i -th household of r -th region.

Although the sampling design was not strictly self-weighting, the procedure used for estimation assumed that the multipliers were uniform for each region X sector. This was done to reduce computational work. As the variations in the multipliers within any region X sector was relatively small, this approximation is unlikely to have vitiated the estimates.

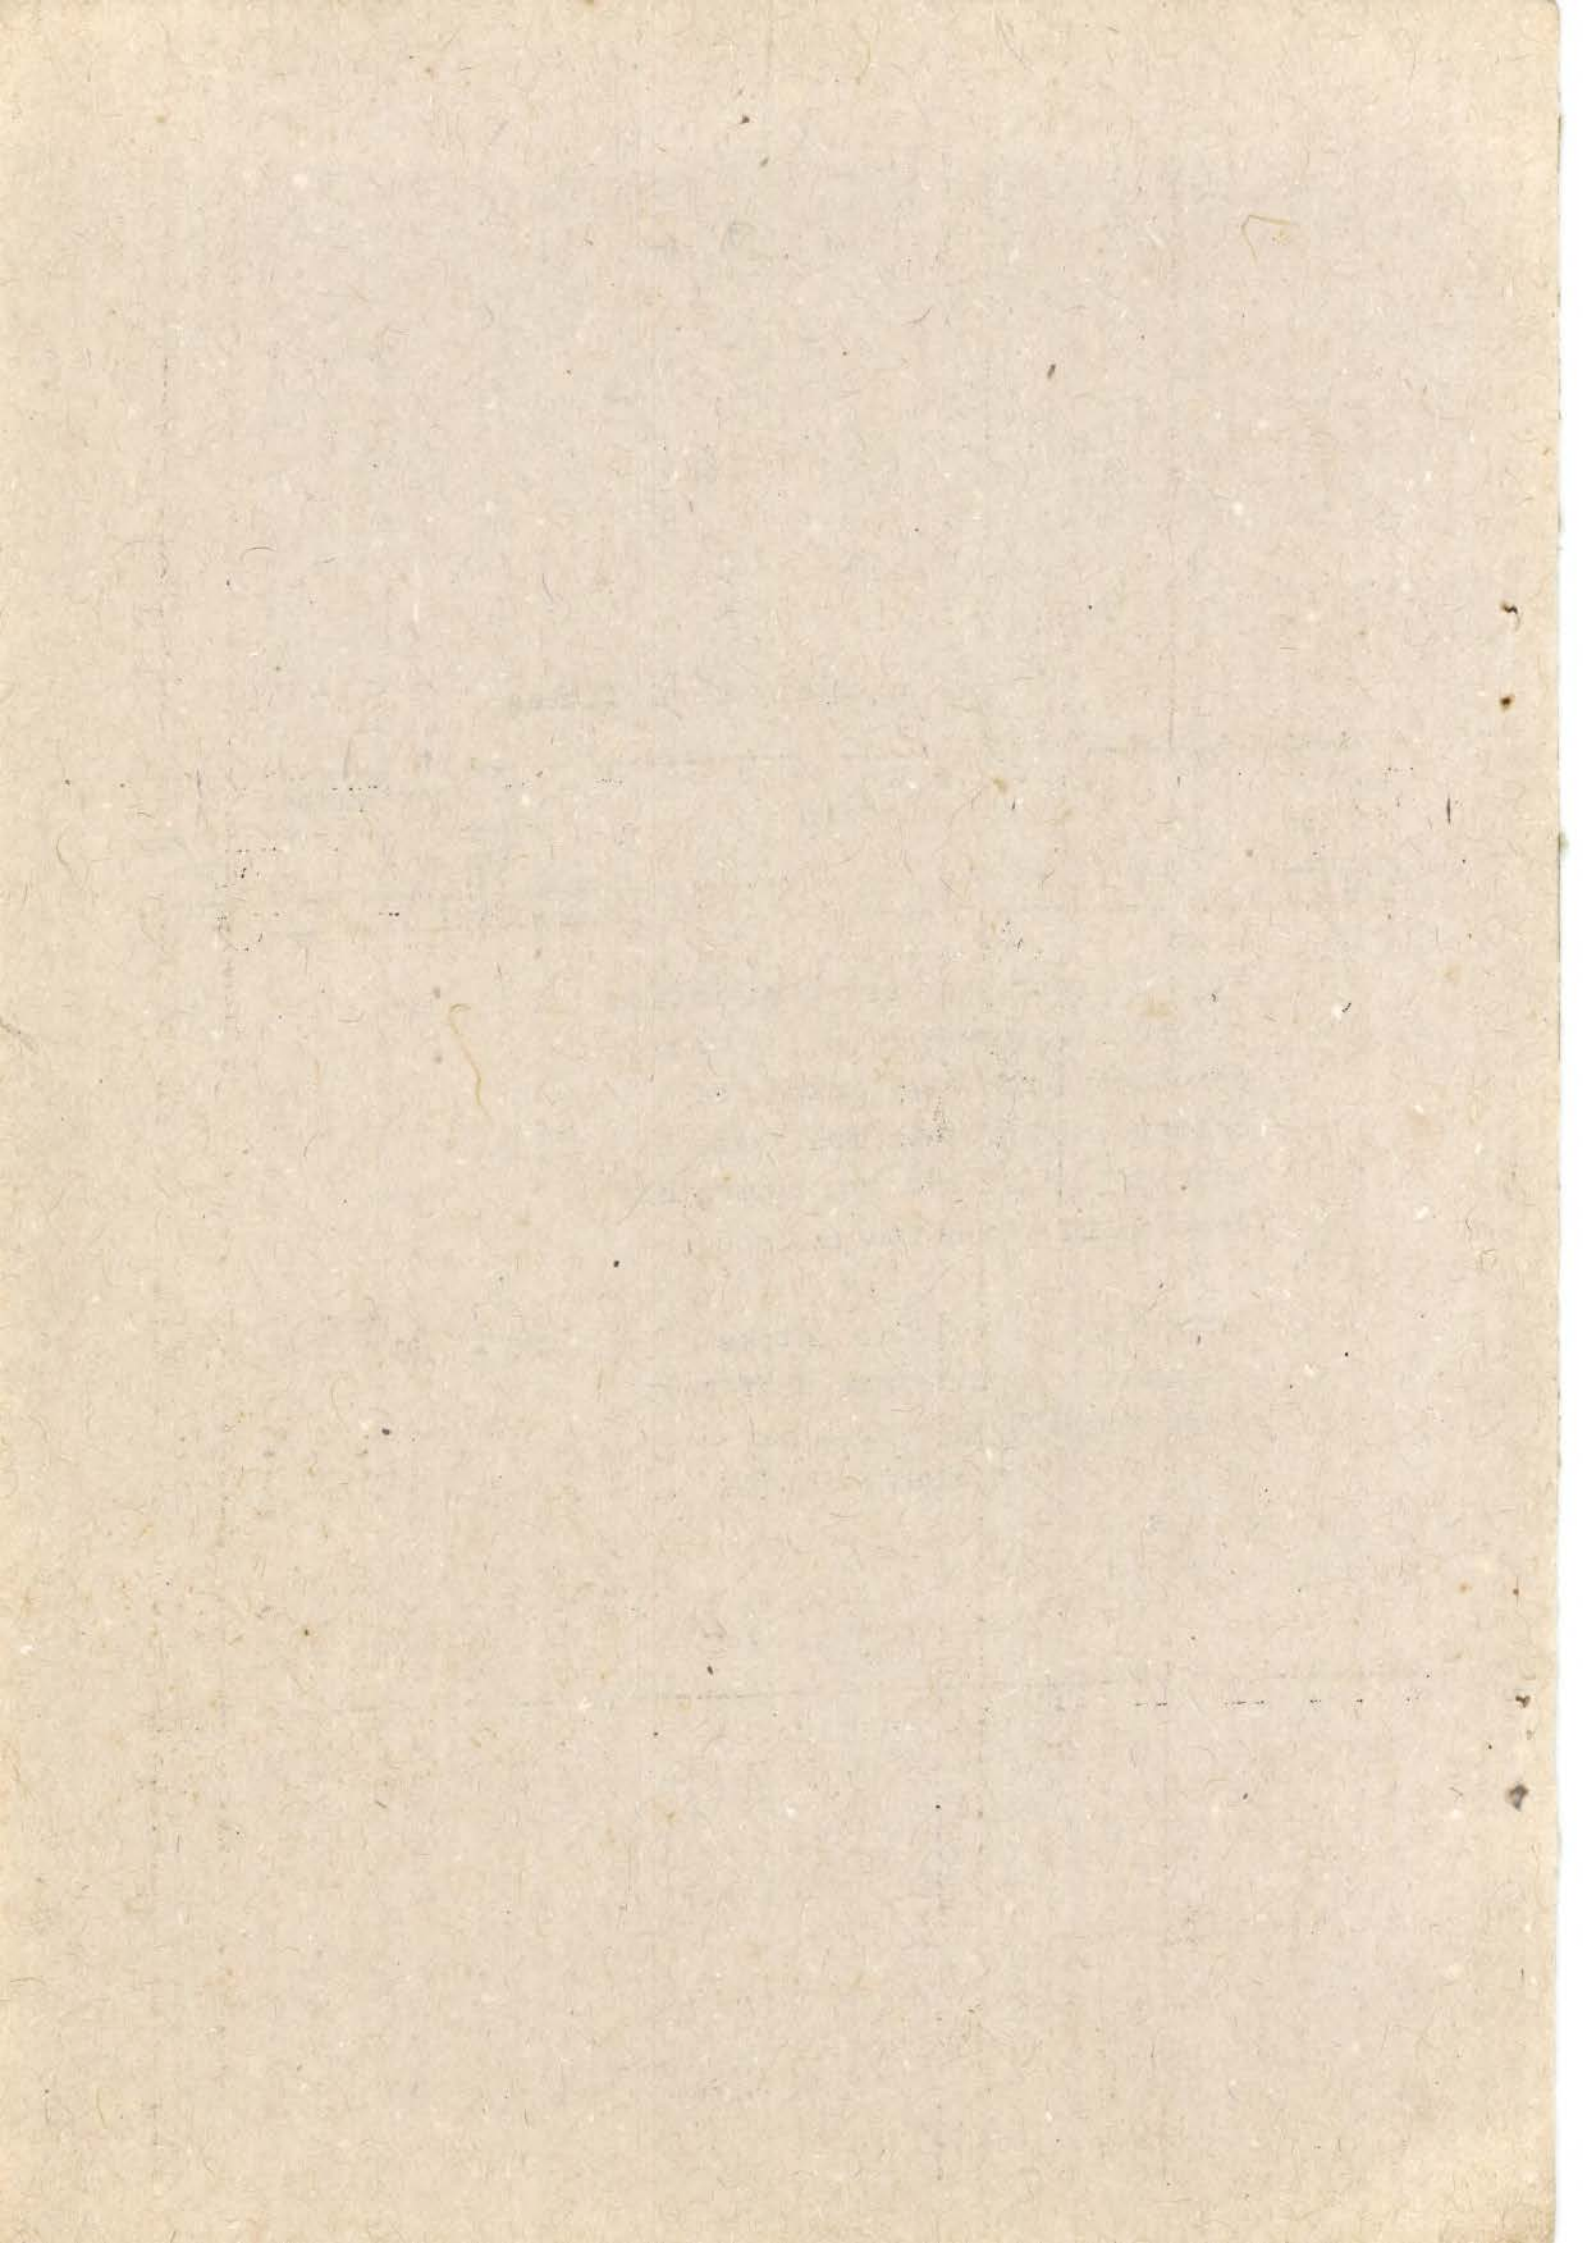

5.11 Estimates of Ratios : Estimate of a ratio of two characteristics is given by the ratio of the estimates of their aggregates.

* The values of P are based on the Expert Committee Projection, tentatively revised in the light of 1971 census data.
