ESTIMATES OF LIVESTOCK AND AGRICULTURAL  
IMPLEMENTS CLASSIFIED BY HOUSEHOLD OPERATIONAL HOLDING

( STATE AND ALL INDIA ESTIMATES )

SECTION ONE

INTRODUCTION

- 1.1.0 Historical background : The survey on land holdings and livestock holdings carried out in the thirtyseventh round (January - December 1982) of the National Sample Survey (NSS) was the fourth in the series of similar surveys conducted so far by the NSSO with the object of obtaining information on the agrarian structure relating to ownership and operational holdings in the country. Three previous surveys on land holdings were conducted in 8th round (July'54 - April'55), 16th & 17th rounds (July'60 - July'62) and 26th round (July'71 - September'72) of NSS and formed parts of World Agricultural Censuses of 1950, 1960 and 1970 respectively initiated by the Food & Agricultural Organisation of the United Nations. In all these surveys apart from collecting information on operational holdings in India to meet the requirements of FAO, data on ownership holdings were also collected. In the 26th round of the NSS the survey on land holdings was, however, integrated with a survey on debt and investment at the instance of the Reserve Bank of India. The thirtyseventh round survey of the NSS was essentially a repetition of the 26th round survey with some modifications in the item coverage and the method of data collection.
- 1.2.0 Geographical Coverage : The 37th round survey was initially planned to cover the whole of the Indian Union except (a) rural areas of Nagaland and (b) Ladakh and Kargil districts of Jammu & Kashmir. Moreover due to operational difficulties and shortage of staff the following areas too could not be surveyed, either, viz., (i) Andaman & Nicobar Islands and Lakshadweep; (ii) Urban areas of Dadra & Nagar Haveli; (iii) Rural areas of Sikkim; (iv) Rural areas of Chattarpur district and urban areas of Guna and Jhabua districts of Madhya Pradesh.

Some Aspects of Household Consumption Expenditure  
and Ownership of Agricultural Assets  
in Agricultural Households

1.3.0 Sample Size :- The all-India sample size in the present survey was fixed at 8408 villages and 5300 urban blocks considering both the Central and State samples together. Of the total, 4144 villages and 2544 urban blocks formed the Central sample and remaining villages and blocks constituted the State sample. At the household level, eight households in each sample villages and six households in each urban sample block were planned to be surveyed for this enquiry. However, due to operational difficulties, shortage of staff and also non-availability of some records at the tabulation stage, the survey results of the Central sample are based on 3692 villages and 2408 urban blocks only. In terms of households, the sample size for the Central sample was 29089 and 14341 in the rural and urban sectors respectively.

1.4.0 Methodology adopted for collection of data : Though essentially a repeat survey on land holdings of previous rounds, the methodology of data collection in the present survey differed significantly from that of previous surveys. While reference periods of earlier surveys were either major crop seasons of the agricultural year or the entire agricultural year preceding the survey period, data on operational holdings were collected in the present survey separately for Kharif and Rabi seasons at the end of each season by making two visits to each sample household at an interval of nearly six months. Apart from getting season-wise information, it was expected that adoption of this methodology would help in reducing the recall error appreciably. The first visit (January to June 1982) was meant to collect information for Kharif season of the agricultural year 1981-82 and the second visit (July to December 1982) for the Rabi season of the same agricultural year.

1.4.1 The data on operational holdings though collected separately for Kharif and Rabi seasons, have been processed and tabulated for the two seasons separately as well as for the major crop season of the agricultural year 1981-82. The information about the major crop season (as defined in para 1.6.7) was collected from each sample household and of the two sets of seasonwise data, one relating to the holdings operated during the major crop season was taken into account for the purpose of tabulation by major crop season.

1.5.0 Presentation of survey results : A large mass of data on ownership, operational and household operational holdings collected in this round have been processed and tabulated. Some important features of ownership and operational holdings have already been brought out in the first and second reports on the subject (NSS draft reports nos. 330 and 331) in July and October 1986 respectively. In order to have a comprehensive account of agricultural activities of a household, estimates relating to household ownership of livestock and agricultural implements, linked with household operational holding, are presented in this report. The details of household operational holdings in the country in terms of size, distribution and ownership of livestock and agricultural implements are given by size-class of household operational holdings. While the results on household operational holdings presented in this report relate to the major crop season of the agricultural year 1981-82, the estimates of inventory of livestock and agricultural implements owned by households refer to the date of survey staggered over the calendar year 1982.

1.5.1 Content of the present report : The present report consists of three sections of text and two appendices. In Section One, apart from a general introduction of the survey, the concepts and definitions of important terms used in the survey and relevant to this report have been provided for proper interpretation of the results. Some salient features relating to different aspects of household operational holdings and household ownership of livestock and agricultural implements are summarised in Section Two. Section Three contains a description of the sample design and the estimation procedure adopted for the survey. In Appendix One, which forms the main body of the report, detailed estimates at the state and all-India levels are presented. Lastly, Appendix Two gives a complete list of NSS reports on Land Holdings and Livestock, based on various rounds of NSS.

Contd.... 4/-

- 1.5.2 In Appendix One, there are in all seven tables for both the rural and urban sectors. While the first table, Table (0), gives the number of sample villages and sample households on which the estimates of this report are based, the remaining tables contain estimates mostly in terms of percentages and averages except for a few key characteristics for which aggregate estimates have been presented. All the six tables containing the detailed estimates have been arranged in three parts. In part one, only the tables containing estimates at all-India level, separately for the rural and urban sectors, are placed. The parts two and three consist of tables containing estimates at the state level respectively for the rural and urban sectors.
- 1.5.3 The estimated number of household operational holdings and the total area operated find place in Table (1) alongwith their percentage distributions, ~~over~~ ~~and~~ average area operated and household size by size-class of household operational holdings. Table (2) provides number of persons with different activity status per household over size-class of holdings. Tables (3), (4) and (5) give estimates of number of livestock and poultry birds owned per 100 households for each size-class of household operational holdings. Estimates of cattle and buffaloes are given in Tables (3) and (4) respectively; and Table (5) covers the remaining species of livestock alongwith ~~the~~ poultry birds. The last table (Table (6) ) gives the number of selected agricultural machinery and implements owned per 100 households by size-class of household operational holdings.
- 1.6.0 Concepts and definitions : The concepts and definitions of the important terms used in the survey and relevant for this report are explained below :
- 1.6.1 Household : A group of persons normally living together and taking food from a common kitchen constituted a household. The members of a household may or may not be related to one another.

Contd.... 5/-

- 1.6.2 Operational holding : An operational holding was a techno-economic unit used wholly or partly for agricultural production (defined in para 1.6.3) and was operated (directed/managed) by one person alone or with the assistance of others, without regard to title, size or location. The holding might consist of one or more parcels of land provided they were located within the country and these as a whole formed part of the same technical unit. By technical unit is understood, in the context of agricultural operations, a unit with more or less independent technical resources covering items like land, agricultural equipments and machinery, draught animals etc. Holdings put exclusively to livestock and poultry raising and for production of livestock and poultry products (primary) and/or pisciculture were considered as operational holdings whereas holdings put exclusively to uses other than agricultural production were not considered as operational holdings. Holdings coming under the operations of co-operative farms were also not considered as operational holdings.
- 1.6.3 Agricultural production : As per the extended definition of agricultural production as adopted in this survey it included growing of field crops, fruits, grapes, nuts, seeds, tree nurseries (except those of forest trees), bulbs, vegetables and flowers both in open and under glass; production of coffee, tea, cocoa, rubber. the forest production in parcels of land which formed part of the enumeration holding and the production of livestock and livestock products, poultry and poultry products, fish, honey, rabbits, furbearing animals and silkworm cocoons.
- 1.6.4 Considering the above definition of agricultural production and the concept of operational holdings, a household was considered to have at least one operational holding if it possessed, at the minimum, one plot in which at least one of the items of agricultural production was carried out during the reference period. Identification of the management signifying distinct economic unit and the distinctiveness of technical units eg. land, agricultural machinery & implement, draught animals etc were the prime factors in determining the number of operational holdings possessed by a household. Whenever there were two distinct managements (different members of the same household) engaged in two different agricultural operations, though using same technical units or whenever under the same management there were two distinct technical units, the number of operational holdings possessed by the

household was taken as two. In this connection it is worth mentioning that a household engaged in, say, rearing of livestock and poultry was considered to have an operational holding even though it did not undertake any crop production during the reference period. However, if the household forming a single economic unit (management) undertook some crop production and was also engaged in livestock/poultry rearing and/or pisciculture during the reference period, the household was generally considered to have a single operational holding even though the technical units were different for different activities. This was considered in view of the fact that in rural areas the production of crop constituted the basic activity of the household, other activities being only ancillary to the basic activity.

- 1.6.5 When an operational holding was identified then all the plots possessed by the household during the major part of the Kharif/Rabi seasons of 1981-82 and coming under the purview of that operational holding were taken into account irrespective of ~~whether~~ whether all plots included in that holding were put to agricultural production or not. Thus if a household possessed at least one operational holding then plots possessed by the household and put to other uses like house-sites, paths, buildings etc. were also included under the purview of the operational holding.
- 1.6.6 Individual and joint operational holdings : An operational holding managed by the members of a single household was taken as an individual holding and a holding managed by members of different households jointly was considered as a joint holding.
- 1.6.7 Major crop season : The major crop season of an operational holding was decided on the basis of the major crop season of the locality in which the holding was situated. It was generally the same over a region covering a number of villages. Major crop season was that season of the agricultural year in which the largest area was brought under cultivation. For this purpose two seasons namely the 'Kharif' and the 'Rabi' were considered where 'Kharif' included both the autumn and the winter Kharif and the 'Rabi' included both the Rabi and zaid 'Rabi' (i.e. summer) seasons.

1.6.8. Household operational holding : The household operational holding was constituted by lands coming under the purview of the different operational holdings possessed by the household. If the household had individual operational holdings only, the sum of the areas of each holding constituted the household operational holding. When the household possessed only joint operational holdings, household operational holding was derived by taking the sum of the households share of area from each of the joint holdings, the share being determined on the assumption that each co-partner household had equal amount of area. In case a household had both individual and joint holding, the sum of the areas of all the individual holdings together with the household's share of area from each of the joint operational holdings constituted the household operational holding. Thus for a household possessing only one individual operational holding, household operational holding and operational holding were identical.

1.6.9 Usual activity status of a member of the household : Usual activity status of a person is defined as that activity which has been pursued for relatively longer time of a reference period of 365 days preceding the date of survey. The activity status is divided into three broad category groups - 'working', 'not working but seeking and/or available for work' and 'neither working nor available for work' (or not in labour force). The 'usual activity status' is decided on the basis of the time spent during the last 365 days in each of the above three broad categories. The codes for the activity status are - 'working' - 1, seeking and/or available for work' - 2, and 'not in labour force' - 3.

Contd.... 8/-

- 1.6.10 A person is considered as 'working' if he/she was engaged relatively for a longer period during the last 365 days in any gainful activity. Gainful activity is defined as the activity pursued for pay, profit or family gain. Normally, it is an activity which results in production of 'goods or services' for exchange. However, the activities in 'agriculture' (all activities included in the industry division - 0) in which the part or whole of the agricultural production is used for own consumption and does not go for sale are considered gainful. The activities such as begging, prostitution etc. which may result in earnings, are, by convention not considered gainful. Execution of household chores or engagement in 'social commitments', etc. are also not considered as gainful activities.
- 1.6.11 A person is considered as 'seeking and/or available for work' if he/she, owing to lack of work has not worked and either sought work through employment exchanges, intermediaries, friends or relatives or making applications to prospective employers or expressing his/her willingness or availability for work under the prevailing conditions of work and remuneration for relatively longer period during the 365 days preceding the date of survey.
- 1.6.12 Persons not so considered as 'working' or 'seeking and/or available for work' constitute the category 'not in labour force'. Persons falling in this category are 'students', 'persons engaged in domestic duties', 'rentiers', 'pensioners', 'those living on remittances, charity, prostitution, etc.' 'infirm and disabled', 'too young or too old etc.'

SECTION TWO  
SUMMARY OF RESULTS

2.1 The present report, as ~~has been~~ mentioned earlier, deals mainly with some aspects of household operational holdings and details of livestock and agricultural implements owned by households. While the estimates pertaining to household operational holdings relate to the major crop season of the agricultural year 1981-82, data relating to the inventory of livestock and agricultural implements refer to the date of survey staggered over the calendar year 1982. All the data presented <sup>in this report</sup> here are based on the Central sample only. In this <sup>section</sup> ~~section~~ some aggregate and ratio estimates, concerning key characteristics and their distribution over the size-class of household operational holdings have been discussed at the all-India level.

2.2 According to the definition of household operational holding as stated in paragraph 1.6.8 of Section One, the number of household operational holdings including the households operating no land is equivalent to the total number of households as estimated from the survey. It may, however, be noted that the number of household operational holdings need not necessarily be equal to the number of operational holdings since some households might not have an operational holding while others might have more than one operational holding. On the other hand, the total area under all household operational holdings is, by definition, equal to the total area under all operational holdings.

2.3 It may be mentioned here that while discussing the summary results in this section, all-India estimates have sometimes been set against the results obtained from the similar surveys conducted in the earlier rounds ~~of the N.S.S.~~

so as to provide a background against which the current results may be viewed.

The estimates based on earlier NSS rounds have been quoted from the reports

~~en~~listed in Appendix-II.

2.4 Some important characteristics of land holdings : The estimates in regard to the number of households and area operated have already been presented in the NSS Draft Report Nos. 330 and 331 respectively. The estimated total number of households based on the survey data was 93855 thousand in rural India and 30076 thousand in urban India. The total area operated during the major crop season has been estimated to be <sup>118567</sup> (118544) and 4874 thousand hectares respectively in ~~the~~ rural and urban India. The key estimates relating to some aspects of land holdings in the rural and urban sectors of India are presented in Table (I).

Table (I) : Key estimates relating to operation of land in rural and urban India during 1981 -82 All India

i t e m	rural	urban
(1)	(2)	(3)
1. estimated number of households (000)	93855	30076
2. estimated number of households operating some land (000)	69396	5435
3. estimated number of operational holdings (000)	71043	(5849) <sup>5848</sup>
4. estimated area operated (000 hectares)	<sup>118567</sup> (118544)	4874
5. area operated per household including those who operate no land or land less than 0.002 ha. (0.00 hectare)	1.26	0.16
6. area operated per household operating some land, i.e. excluding those who operate no land or land less than 0.002 ha. (0.00ha.)	1.71	0.90
7. P.C. of households operating no land <sup>or land</sup> less than 0.002 hectare.	26.06	81.93

N.D.

2.5 Of the 93855 thousand households estimated in the rural sector only 69396 thousands operated some land (0.002 ha. or more). Thus the households operating no land or land less than 0.002 hectare constitute 26.06 per cent of the rural households. In the urban sector as high as 81.93 per cent of the households <sup>were</sup> found to operate no land <sup>or</sup> land less than 0.002 hectare. <sup>Altogether</sup> This <sup>is clearly evident</sup> bears the evidence of relative predominance of operating households in the rural sector. <sup>yet</sup> Nevertheless the number of households operating no land, estimated to <sup>be</sup> about one-fourth of the rural households, is quite considerable in view of the fact that agriculture is the mainstay of rural India.

2.6 The estimated area operated by the households of the rural sector was 118544 thousand hectares and only 4874 thousand hectares in the urban sector. Thus, of the estimated total area operated (123418 thousand hectares) only about 4 per cent was operated by the urban sector. Though the area operated per operating household in the urban sector <sup>was</sup> as high as 0.90 hectares, the area operated per household including those who operate no land was found to be only 0.16 hectares. This is clearly because of the high percentage of households operating either no land or land less than 0.002 hectare in urban India. In the rural sector, however, the average size of household operational holdings ( 1.26 hectares) <sup>is</sup> was not <sup>so</sup> far short of the average (1.71 hectares) worked out for the households operating some land.

2.7 It is worthwhile to observe that area operated per operational holding and per operating household (excluding household operating no land or land less than 0.002 ha.) compare each other closely. In the rural sector, the area per operational holding was 1.67 hectares, which was very close to the area per household operational holding (1.71 hectares) . This indicates that the households possessing multiple operational holdings were not many in number .

N.D.

2.8 Since the contribution of the urban sector to total area operated is not appreciable, the rest of the discussion has been confined mainly to the rural sector.

2.9 Temporal changes in key characteristics relating to land holdings: To assess the changes in different aspects of land holdings during the last two decades, it is worthwhile to make a comparative study of relevant estimates obtained from the three land holdings survey conducted by N.S.S in the sixteenth and seventeenth round (1960-61 & 1961-62), twenty sixth round (1971-72) and the current thirtyseventh round (1982).

2.10 Before turning to the results, it is necessary to review the definitions and concepts of land holdings adopted in different rounds so as to render the comparison of estimates thrown up by them more meaningful. The definitions of an operational holding were essentially the same in all three rounds except in that the holdings used exclusively for livestock and poultry raising and for production of livestock and livestock products and/or pisciculture were considered as operational holdings in the 26th and 37th rounds but not in the previous rounds. In all the rounds, the area of the household operational holding was taken to be the sum of areas of all the individual operational holdings, together with a part of the area of each of the joint operational holdings apportioned equally among the participating households.

2.11 Table (II) below shows the temporal changes in the extent of estimates relating to operation of land. As mentioned earlier, the study is confined to the rural sector only.

Table (II) : Key estimates relating to operation of land from the various NSS rounds.

i t e m (1)	Rural		
	All India 17th rd (2)	26th rd (3)	37th rd (4)
1. estimated number of households (000)	72466	78370	93855
2. estimated number of households operating some land (000)	52900	56884	69396
3. estimated area operated (000 hectares)	133482	125684	118544
4. area operated per household including those who operate no land (0.00 hectares)	1.84	1.60	1.26
5. area operated per household operating some land (0.00 hectares)	2.52	2.20	1.71
6. p.c. of households operating no land or land less than 0.002 hectare	26.86	27.41	26.06

2.12 The above table reveals distinctive features of ~~change~~ in the important characteristics of land holdings. Definite trends are discernible in some characteristics while others indicate little <sup>change</sup>. The average area operated by an operating household had decreased from 2.52 hectares to 1.71 hectares during the last two decades. The steady growth in number of households seems to be the principal factor responsible for subdivision of operated area with consequential increase in the number of households operating some land.

2.13 Despite the steady increase in the number of operating households ~~from~~ from 53 to 69 million, the total area operated had fallen consistently from 133 million to 119 million hectares during the last two decades. Apart from the increasing subdivision of operational holdings, the shrinking of area of land put to agricultural operation is the likely reason for declining trend in area operated per operating household.

2.14 As regards the percentage of households operating either no land or land less than 0.002 hectare, the variation in the estimates of the different rounds is too little to suggest any significant change. In the seventeenth and twentysixth round the estimates are close to 27 per cent and that based on the thirtyseventh round data is about 26 per cent.

2.15 Distribution of households and area operated over size-class of household operational holdings :

The percentage distribution of households and area operated over size class of household operational holdings as obtained in the ~~three~~ three NSS rounds are presented in Table (III).

N.D.

Table (II) : Percentage distribution of households and area operated over size class of household operational holdings.

The percentage distribution of households and area operated over size class of household operational holdings as obtained in the census 1957 records are presented in Table (III).

Table (III) . Percentage distribution of number of households and area operated.

All India

Sector : Rural

size class of household operational holding (hectares)	percentage distribution of number of households			percentage distribution of area operated		
	17th	26th	37th	17th	26th	37th

0.00 1/ 0.002	26.86	27.41	26.06	-	-	-
0.02 - 0.20	9.09	8.04	16.50	0.33	0.47	0.74
0.21 - 0.40	6.01	6.89	7.46	0.97	4.22	1.71
0.41 - 1.00	15.63	17.94	17.19	5.77	7.56	9.13
1.01 - 2.02	16.17	16.44	14.45	12.75	14.91	16.71
2.03 - 3.03	9.02	8.66	7.19	11.99	13.31	14.11
3.04 - 4.04	4.81	4.28	3.40	9.04	9.30	9.47
4.05 - 5.05	3.44	3.08	2.59	8.33	8.60	9.30
5.06 - 6.07	1.98	1.64	1.31	5.96	5.62	5.84
6.08 - 8.09	2.53	2.15	1.61	9.51	9.30	8.89
8.10 - 10.12	1.50	1.23	0.82	7.26	6.88	5.91
10.13 - 12.14	0.87	0.71	0.47	5.19	4.84	4.15
12.15 - 20.24	1.44	1.12	0.73	11.81	10.49	8.91
20.25 & above	0.65	0.41	0.22	11.09	7.50	5.16
all sizes	100.00	100.00	100.00	100.00	100.00	100.00

1/ households operating either no land or land less than 0.002 ha. are included here.

N.D.

2.16 A general feature of the distribution of land holdings is a high degree of concentration. Large number of households/operating small-sized holdings has minor share of area while only a few households with large holdings command substantial share of the total area operated. As has been observed in the past, the percentage of households ~~were~~<sup>was</sup> found to have decreased progressively over the higher size classes of household operational holding in the 37th round. The percentage of area operated, on the other hand, were higher in the higher size classes. As can be seen from the results of the 37th round survey that about 60 percent of the households in lower size bracket of upto 1.00 ha. (including holdings of size 'nil')<sup>operated</sup> only about 12 percent of land. At the other extreme, about 1.5 percent of the households with operational holdings of 12.15 hectares or more claimed more than 14 per cent of the operated area.

2.17 Comparing the distribution of households over size-class of household operational holdings obtained from the current round with those from the earlier rounds, it is observed that the percentage of households operating no land ~~was~~ remained more or less unchanged, around 27 percent, during the last two decades. The percentage of households in the class ~~0.01-0.20~~<sup>0.01</sup> 0.01-0.20 hectare, however exhibit a substantial rise from 9.09 percent in 1961-62 to 16.50 in 1981-82. A consequential rise in the share of area operated by the households in this class is also evident from the table. In the size-classes 0.21-0.40 and 0.41-1.00 hectare, the percentages of households shows very little increase, though the corresponding shares of area operated ~~increased~~ increased appreciably over the period. On the other hand, in the size-classes 1.01-2.02, 2.03-3.03, 3.04-4.04 and 4.05-6.07 hectares, the shares of area operated by the households of the respective size-classes reveal a rising trend while <sup>the</sup> percentages of households declined steadily. However, both percentage of households and percentage of area operated, in each of the size-classes 6.08-8.09 and above, were found to have declined steadily during the last two decades.

Table (IV) : Cumulative percentage distribution of households and area operated over size class of household operational holding in different rounds of NSS.

size class of household operational holding (hectares)	Sector : Rural						
	households			cumulative percentage of area operated			
	(1)	(2)	(3)	(4)	(5)	(6)	(7)
less than 0.002	26.86	27.41	26.06	-	-	-	-
"	0.20	35.95	42.56	0.33	0.47	0.74	0.74
"	0.40	41.96	50.02	1.30	1.69	2.45	2.45
"	1.00	57.59	67.21	7.07	9.25	11.58	11.58
"	2.02	73.79	81.66	19.82	24.16	28.29	28.29

2.18 The extent of concentration of land in the hands of a minority of households operating large holdings is better depicted in Table (IV), which gives the cumulative percentage distribution of households holding operating land below specified size of household operational holdings and of the area operated by them.

2.19 Table (IV) reveals that about 50 percent of the total rural households operating holdings of size less than 0.40 hectares possessed only about 2.5 percent of the total area operated in 1981-82. Further, about 82 percent of the households with holdings less than 2.02 hectares possessed only about 28 percent of the total land operated. At the other extreme lies only about 1 percent of the households who operated <sup>12.14</sup> hectares or more and commanded about 14 percent of the total operated area.

As an overall measure of inequality the concentration ratio for the distribution of household operational holdings has been given for the seventeenth, twentieth and thirtieth rounds in Table (V).

Table (V) : Concentration ratios of household operational holdings for different NSS rounds.

ALL-INDIA	RURAL
NSS rounds	concentration ratio @
(1)	(2)
17th	0.71
26th	0.70
37th	0.73

As can be seen from ~~the~~ Table (V) the concentration ratios depict no significant change in the distribution patterns of household operational holdings and of area operated by them during the last <sup>two</sup> decades. If there had been any change in the unevenness of the distribution, it was towards greater inequality in 1981-82.

Note : @ concentration ratio :

$$C = 1 - \frac{(P_j - P_{j-1})(Q_j + Q_{j-1})}{10^4}$$

$P_j$  and  $Q_j$  are respectively the cumulative percentage of households and area operated in the  $j$ th size-class of household operational holdings as presented in Table (IV)

2.20 Distribution of household operational holdings in the major states :

So far the discussion was confined to the general features of household operational holdings at the all-India level. Now, in order to make a comparative study of the land holding structures of the states, the distributional aspects of household operational holdings are taken up at the state level in respect of the current survey. The percentage distribution of the number of households and the area operated in ~~the~~ five broad categories of household operational holdings are given in Table (VI), the five categories being -

- i) marginal holdings of size less than 1.01 hectares,
- ii) small holdings of size from 1.01 to 2.02 hectares,
- iii) semi-medium holdings between 2.03 to 4.04 hectares,
- iv) medium holdings of size 4.05 to 10.12 hectares, and
- v) large holdings of size 10.13 hectares and above.

2.21 A general feature of household operational holdings observed in the thirtyseventh round is that the proportion of households decreased successively with the higher category of land holdings. More than 50 percent of the households belonged to the marginal category in all the states except in Rajasthan and Madhya Pradesh. The proportion of marginal holdings was highest in Kerala, about 90 percent, followed by West Bengal and Bihar with respectively 80 and 75 percent of their households coming under the marginal category. Whereas the share of area operated by the marginal holdings was generally very low. However Kerala presented itself as a striking exception with 46 percent of its operated area under marginal holdings. West Bengal, Jammu and Kashmir and Bihar were also among the notable exceptions having respectively about 30, 29 and 23 per cent of their operated area covered by the marginal holdings.

2.22 The share ~~xx~~ of land under small holdings was more or less of the same order as the proportion of households operating them in most of the states. At ~~the~~ all-India level, the households operating small holdings accounted for about 14 per cent of the total number of households and had about 17 percent of the operated area with them. But for a few exceptions this was the pattern ~~xx~~ in all the states. The exceptions were Rajasthan and Madhya Pradesh, where the percentage of area operated by the small holdings was far less than the

18. all-India	1.26	67.21	14.45	10.59	6.33	1.42	11.58	16.71	23.58	29.94	18.22

percentage of the number of households, and Kerala, West Bengal and Tamil Nadu, where the percentage of area under small holdings was more than double of the percentage of households belonging to the same category.

2.23 In the semi-medium category the share of land was found to be more than the proportion of households with such holdings except in Rajasthan where about 20 percent of the households possessed about 17 percent of operated area. The categories of medium and large holdings commanded proportionately larger shares of land compared to the number of households under such categories. In general the proportion of large holdings was very low. The lowest figures were reported by Jammu and Kashmir, West Bengal, Kerala, Tamil Nadu and Himachal Pradesh, the proportion of such households being less than 0.20 percent of total households in respective states. In Rajasthan, Maharashtra and Madhya Pradesh, however, the large holdings were proportionately more in number, percentages being 6.33, 3.42 and 2.96 respectively.

2.24 From what has been discussed above, three distinct groups of states with three distinct structures of household operational holdings can easily be identified. Rajasthan, Madhya Pradesh and to a certain extent Maharashtra can be said to have distributions with relatively higher shares of larger holdings. Whereas the states Kerala, West Bengal, Bihar and Tamil Nadu can be put in a group with distributions bearing larger shares of small and marginal holdings. The rest of the states follow almost the same distribution as the one obtained at the all India level.

2.25 Further, as revealed from the table, the average household operational holding was highest in Rajasthan (3.26 hectares), followed by Madhya Pradesh (2.07 hectares) and Maharashtra (1.84 hectares), while that in Kerala (0.37 hectares), Tamil Nadu (0.56 hectares) West Bengal (0.61 hectares) and Bihar (0.83 hectares) were very low. The rest of the seventeen major states reported average household operational holding lying well within the interval of 50 percent of the all India estimate (1.26 hectares).

2.26 What finally emerges from the above discussion is that the structure of land holdings ~~of different states~~ of different states is closely related to the average size of household operational holding. The distributions of number of households and area operated by the five broad categories of household operational holdings obtained in the seventeen major states are dependent to a great extent on the land available for agricultural operation viz-a-vis the number of households in the states.

2.27 Household size with break-ups by activity status of the members for each size class of household operational holding :

The purpose for collecting information on activity status of individual members of households was to study the relation, if any, between household size under break-downs for activity status of individual members and the size of household operational holding. Table (VII) gives ~~gives~~ the average number and percentage distribution of members of households with different activity status by the size class of household operational holdings for the rural sector and only for all size-classes for the urban sector. It may be recalled here that the estimates relate to usual activity status.

2.28 In the rural sector, as is seen from Table (VII), the household size ranged from 4.11 for households operating no land to 9.03 for households operating 20.25 hectares or more. The household size was found to follow an increasing trend with the increase in the size of household operational holdings. The average size of a rural household was 5.44 and was larger than the average size of 4.98 of an urban household.

2.29 Out of the total household size of 5.44 in rural India, on the average, 2.23, 0.05 and 3.15 persons were found to be working, seeking or available for work and out of labour force respectively. The number of working persons comprised 41 percent of the rural population, while 58 percent of the persons were out of labour force. It may be noted that in the urban sector the percentage of working population was smaller while percentage of population out of labour force larger than those observed in the rural sector.

N.D.

2.30 The variations in the number of persons working and those out of labour force in a household exhibited trends similar to that the household size followed over the size classes of household operational holdings. But the percentage distributions over activity status for each size class of household operational holdings present a slightly different picture. Among the households operating some land the percentage of working persons clearly exhibited an increasing trend with the increase in the size of holding operated by the households. The percentages of persons who were out of labour force, on the other hand, were found to decline steadily with higher size-class of household operational holding. As regards the percentage of household members who were seeking or were available for work, no notable trend could be identified.

2.31 Livestock and Poultry : Besides information on operation of land, particulars on livestock and poultry owned by the households on the date of survey during the calendar year 1982 are also presented in this report. The distributions of the estimated number of livestock and poultry per 100 households by size class of household operational holdings are discussed here with emphasis on the bovine stock.

2.32 Size and composition of the bovine population : Agriculture being the mainstay of rural India, the bovine population forms the most important part of the total livestock of the rural households. The male bovine, the major source of draught power in Indian agriculture, has a very crucial role to play in the rural economy, while the society depends largely on the female bovine for its milk supply. Viewing the sex-ratio among the adult bovine population in this light, it is seen that the services rendered by the bovine stock as a source of draught power and as milch animal are evenly poised in the rural sector. It is seen from Table (VIII) that among the adult bovine there were about 99 males for every 100 females. In the urban sector, however, the sex-ratio was found to be noticeably in favour of female bovine, the number of males per 100 females being only 52.

11.	grand total		168.83	x	x	67.34	x	x	236.17	x	x

2.33 It is seen from the table that the cattle constituted a major part of the bovine population. In the household sector of the country as a whole the cattle formed 71.49 per cent of the total bovine population. The proportion of cattle in the rural sector was about 72 per cent and that in the urban sector about 67 per cent. About 31.58 per cent of the total cattle were adult females and 43.03 per cent were adult males in the rural sector. In contrast, about half of the buffaloes were she-buffaloes and less than one-fifth were males. A relatively greater importance of male cattle as draught animals and she-buffaloes as milch animals need hardly be emphasised further.

2.34 Average number of livestock and poultry by size class of household operational holdings : The average number of livestock and poultry birds owned per 100 households in the rural sector with a few breakdowns are given by size class of household operational holding in Table (IX). Since less than 5 per cent of the total bovine is owned by the urban households, the above breakdowns are not given by size class of household operational holdings for the urban sector. Instead, table contains only the average number of livestock and poultry birds owned per 100 households in the urban sector as a whole.

2.35 As expected, the number of bovine per 100 households increased with increasing size of household operational holding, and the trend was especially pronounced in the case of working bovines. The dominance of cattle amongst the working bovine is obviously due to the fact that, as draught animals, bulls and bullocks are preferred to he-buffaloes. Only about 10 per cent of the working bovines were buffaloes in almost all the size classes.

2.36 The number of female bovine in-milk per 100 rural households, also, showed an increasing trend with increasing size of household operational holdings. In this case, however, the number of buffaloes were of the same order as that of cattle. For every 100 households there were 20 cattle and 17 buffaloes in milk. In spite of larger numbers of total cattle than total buffaloes per 100 household in each of the size classes, the corresponding numbers in milk were close to each other. Consequently, in terms of proportion, there were larger number of she-buffaloes in milk than amongst the cattle. That the rural households in general prefer to possess buffalo for the purpose of milk production is borne out by the estimates quoted above.

2.37 About 48 per cent of the total bovine population was found to be either working or in milk. It is noticed from the table that there was, by and large, an increasing trend in the percentages of bovine either working or in milk with the increase in size of holdings.

2.38 Composition of the bovine population in seventeen major states :

The average number of livestock and poultry per 100 rural households with a few breakdowns are given in Table (X) for seventeen major states. Since the number of bovine population as well as the total number of households and area operated varied widely between states, the forthcoming discussion has been confined to comparison between number of livestock per 100 households only.

2.39 It is seen from the table that even the average number of bovine per 100 households varied widely between states, ranging from 80 in Kerala to 398 in Himachal Pradesh. Moreover the composition of bovine population happened to have extremely divergent patterns in these states. The number of cattle was, in general, found to be more than that of buffaloes; but, ~~but~~ only about 37 and 40 per cent of the bovine population were cattle in Punjab and Haryana. On the other hand, in some of the states of eastern region, viz. Assam, West Bengal and Orissa, cattle was by far the dominant constituent of the bovine population, about 96, 95 and 91 per cent being the proportion of cattle respectively in these states. Considering the working bovine and bovine in milk together, it is seen that about 48 per cent of the bovine population of the rural sector were either in milk or working at the all-India level. But in the states of Punjab, Rajasthan and Haryana the proportion of bovine either working or in milk was found to be 40 per cent or less, while in Assam, West Bengal and Orissa the proportion was as high as 55 per cent or more.

2.40 It is observed from the table that the working cattle outnumbered the working buffaloes by a wide margin in almost all the states, Kerala being the only exception to the general pattern with approximately equal number of working cattle and working buffaloes in the household sector. Still, a wide variation in the use of buffaloes as a draught animal between the states can be noticed quite clearly. Particularly, in Gujarat, Himachal Pradesh and to some extent Tamil Nadu the working buffaloes were negligible. For the animals in milk, however, the pattern is different. The percentage of buffaloes in milk to total bovine in milk was subject to a wide variation over the states. She-buffaloes were found to dominate in Haryana, Punjab, Uttar Pradesh and Gujarat, the percentage of buffaloes

JR. Note : \* Obtained as sum of cross bred and other cattle 'in milk'

in milk to total bovine in milk being 80, 74, 64 and 62 respectively, while in rest of the states, cows in milk were found to be larger in number than she-buffaloes in milk. Particularly, in some of the states of eastern region, viz., Assam, West Bengal and Orissa and also in Kerala, cows in milk accounted for more than 95 per cent of the total bovine in milk.

2.41 Distribution of the ovine population in the rural sector over size-class of household operational holdings : For every 100 households there were 105 sheep and goats in rural India. The table reveals an increasing trend in the number of ovine owned per 100 households with increasing size of household operational holding. While there were only 33 ovine per 100 households with no operational holding, the households with holdings of 20.25 hectares or more owned about 1000 ovine on the average. There was a considerable variation in ownership of ovine between the states. In Rajasthan and Himachal Pradesh the number of ovine per 100 households was found to be 449 and 307 respectively, whereas Kerala, Punjab and Uttar Pradesh reported only 39, 63 and 65 per 100 households.

on  
2.42 Number of agricultural implements : Information on various agricultural implements owned and possessed by the households on the date of survey were collected during the calendar year 1982. The distribution of estimated number of agricultural implements per 100 households by size-class of household operational holdings are presented in the main body of the report. Here, only a few selected implements viz., ploughs, pumps and tractors, have been considered. For obvious reasons, the discussion has been confined to the rural sector only.

Table (XI) : Estimated number and average per 100 households of selected agricultural implements derived from twentysixth and thirtyseventh round

All-India		Sector : Rural		
i t e m	number (000) owned		number per 100 households	
	26th round	37th round	26th round	37th round
(1)	(2)	(3)	(4)	(5)
1. ploughs (wooden)	54898 (88.64)	52339 (81.86)	70.05	55.40
2. ploughs (iron)	7038 (11.36)	11598 (18.14)	8.98	12.28
3. ploughs : total	61936 (100.00)	63977 (100.00)	79.03	67.68
4. pumps	3879	8465	4.95	9.01
5. tractors	78	484	0.10	0.52

Note : figures in parentheses give percentages of wooden and iron ploughs to total number of ploughs

2.43 The households in rural India, it can be seen from Table (XI), owned 63937 thousand ploughs in 1982, of which about 82 per cent were wooden. The number of pumps and tractors owned by the rural households were respectively 8465 and 484 thousands in 1982. These results when compared with the estimates of ploughs, pumps and tractors in 1971-72, obtained from the NSS twentysixth round data give the impression that considerable mechanisation has taken place in Agriculture during this period. There were substantial rise in the number of pumps and tractors during the decade. The number of pumps was more than doubled while the number of tractors increased by more than six times. Moreover, a distinct change, in so far as the proportion of wooden and iron ploughs are concerned, can ~~be~~ also be noticed in the household sector of rural India. While the total number of ploughs owned by the rural households increased by about 3 per cent, the percentage of wooden ploughs went down from 89 to 82 per cent during the decade. Evidently, more of rural households have taken to implements either relating to mechanisation of Agriculture or of higher efficiency.

2.44 The estimated number of the selected agricultural implements owned by an average hundred households in rural India also points in the same direction. The number of wooden ploughs per 100 households recorded a fall from 70 in 1971-72 to 55 in 1982 ~~xxxx~~ where as the number of iron ploughs per 100 households rose from 9 to 12. The number of pumps per 100 households had almost doubled and the tractors rose by more than five times. Still, the average number of tractors owned per 100 households was negligibly small viz., 0.52, in other words 5 tractors per thousand households.

2.45 Distribution of agricultural implements : In the preceding paragraphs, some important features relating to a few selected agricultural implements have been discussed. It is, nevertheless, important to examine the distribution of these implements per 100 households over size class of household operational holdings. Table (XII) gives the average number of ploughs (wooden), ploughs (iron), pumps and tractors owned per 100 households.

2.46. As expected, the number of these agricultural implements owned per 100 households increased with the increase in the size of household operational holdings. The rising trends were particularly pronounced for tractors and pumps. The average number of tractors owned by the households with marginal holdings was negligibly small. Whereas in the size-class 20.25 hectares and above, one in seven households owned a tractor. In case of pumps, the trend was equally steep, though the pumps were not as rare as the tractors. As regards the distribution of iron and wooden ploughs, it is found that proportionately more iron ploughs were owned by households operating holdings of higher size-classes.

Table (XII) : Distribution of number of agricultural implements owned per 100 household

All-India

Sector : Rural

all sizes	55.40	12.28	67.68	9.01	0.52

2.47 Assessment of the survey results : A comparison of the survey results in respect of the number of households with the 1981 population census figures has already appeared in the NSS Draft Report no. 330. The comparison reveals that the results obtained from the two sources are quite close to each other, the NSS estimates being higher than the census figures by only about 0.03 and 2.42 per cent respectively for the rural and urban sectors of India. As regards the comparability of the survey results relating to area operated with those obtained from the agricultural census 1980-81, a detailed discussion has been made in the NSS Draft Report no. 331. In short, the estimate of the total area operated obtained from the current round was considerably less than the figure of the agricultural census. The current round estimate was only about 73 per cent of the census figure. The plausible reasons for such a large difference has been discussed in the above-mentioned report. Here, a brief comparison of the survey results on the other characteristics presented in this report has been made with the results from other agencies and NSS rounds.

2.48 The percentage distribution of persons over different usual activity status obtained from the current round are placed against those from the 38th round NSS (1983) in table (XIII). It may be mentioned that the 38th round of NSS was oriented towards a detailed study of employment-unemployment situation of India. Comparing the distributions obtained.

Table (XIII) : Percentage distribution of persons over usual activity status obtained from 37th and 38th round of NSS.

All-India		Rural		
NSS round	working	not working and seeking or available for work	out of labour force	total
(1)	(2)	(3)	(4)	(5)
37th	41.07	0.92	58.01	100.00
38th	39.09	0.76	60.15	100.00

Narayan/

Comparing the distributions obtained from the two rounds, it is seen that the estimates are reasonably close. However, it may be noted that a smaller proportion of the population were reported to have been in the labour force in the 38th round. Absence of probing, in depth, in the 37th round might have been responsible for the over-reporting of persons in labour force.

2.49 The size of bovine, ovine, pig~~s~~ and poultry birds~~s~~ population of India obtained from the current round and those from the 30th round of NSS and livestock censuses of 1972 and 1977 are given in Table (XIV) for the rural and urban sectors combined.

Table (XIV) : Comparison of 37th round NSS estimates with 1972 and 1977 livestock census figures and with 30th round NSS estimates relating to size of bovine, ovine, pig~~s~~ and poultry ~~population~~<sup>bird</sup> population of India.

All-India rural and urban combined (in millions)

item	livestock census 1972	NSS 30th round	livestock census 1977	NSS 37th round
(1)	(2)	(3)	(4)	(5)
1. cattle	178.34	157.79	180.14	168.84
2. buffalo	57.43	55.50	62.03	67.35
3. sheep and goat	107.51		116.53	103.02
4. poultry birds	138.54		160.87	148.14
5. pigs	6.90		7.65	6.18

2.50 It may be mentioned here that the thirtieth round of NSS, carried out during July 1975 to June 1976, was entirely devoted to the study of livestock number, products and enterprises. As can be seen from the table that, in respect of the number of bovines under the two species, the current round estimates are on the higher side than those of 30th round. But, as in the 30th round, the size of the stock of cattle, as estimated from the current round data, is smaller than both the 1972 and 1977 livestock census figures. The estimated size of the buffalo stock appears to be quite consistent, considering the growth in the size of the buffalo population during ~~the~~ 1977 to 1982. The census figures of 1972 and 1977 reveal a quinquennial growth rate of about 8 percent. The quinquennial growth rate obtained from the current round estimate and the 1977 census figure works out to about 8.5 percent. As regards sheep and goat, poultry birds and pigs, the aggregate figures of

the current round at the all-India level, for the rural and urban combined, are generally on the lower side as compared to those of 1977 livestock census. It may be noted here that the NSS covers only the household sector, while the coverage of census includes non-household sector as well. The lower estimates from the NSS round may be partly due to their smaller coverage as compared to the census. However the estimates of the number of sheep and goat, poultry birds and pigs at the state-level are subject to wide variations, especially in the case of pigs. The emphasis of the 37th round NSS being on the study of land holdings, the design was probably not suited for estimation of pigs, which are generally kept by a small section of the household sector. Evidently, the state-level estimates in this case, are based on a very few reporting sample households and are consequently far less reliable than the all-India estimates.

Table (XV) : Number of a few agricultural implements obtained from the NSS 37th round and 26th round, and 1972 and 1977 livestock census figures.

All-India item	Rural number owned (000)			
	37th round NSS	1977 livestock census	1972 live- stock census	26th round
(1)	(2)	(3)	(4)	(5)
1. wooden ploughs	51995	35722	35703	54898
2. iron ploughs	11522	5994	4639	7038
3. pumps (diesel + electric)	8465	4502	2134	3879
4. tractors	484	241*	124*	78

... level estimates in ...  
... and ...  
... estimates.

2.51 Table (XV) provides a comparison of the estimates from the current round with 1972 and 1977 livestock census figures and 28th round estimates relating to the number of wooden and iron ploughs, pumps and tractors. So far as the ploughs are concerned, the NSS estimates are not in agreement with the census figures. While the number of wooden ploughs estimated in the current round <sup>was</sup> about 52 millions, the number recorded in both 1972 & 1977 livestock census was about 36 millions only. But, the current round estimate of the number of wooden ploughs are quite close to that of the 26th round. Moreover, the estimates of iron-ploughs obtained from the two NSS rounds depict <sup>an</sup> increasing trend similar to the one indicated by the two census figures, though the NSS estimates of both the rounds are not in agreement with the corresponding census results in this case also. The greater numbers of pumps and tractors in 37th round, which relate to the year 1982, in comparison to the livestock census of 1977, probably indicate a growing use of improved agricultural implements rather than presence of any error in the estimates of NSS. It may be noted that the number of pumps and tractors have increased by about 111 and 94 percent respectively between the 1972 and 1977 livestock census.

N.D.

A NOTE ON SAMPLE DESIGN AND ESTIMATION PROCEDURE

3.1 Sample Design

3.1.1 Broad design : The broad sample design was stratified with two stage sampling in each stratum. The first stage units in the rural sector were 1981 census villages in most districts, but in a few cases where either 1981 census was not conducted or the frame of census villages could not be procured in time, 1971 census villages were used. In the urban areas, the first stage units were generally blocks formed in the NSS urban frame survey in all towns except those places which were declared as urban areas for the first time in 1981 Census. In such cases, the Census (1981) blocks were the first stage units. The second stage units were households in both rural and urban sectors.

3.1.2 Regions and strata : Each State/Union Territory was divided into a few agro-economic regions by grouping contiguous districts similar in respect of population density and crop pattern. In Gujarat, some districts were split for this purpose, considering the location of dry areas and the distribution of tribal population in the state. The total number of regions thus formed all over India (excluding areas not covered by NSS) was 77. "Basic strata" for sampling in rural areas were formed within each region. Each district with less than 1.5 million 1971 census rural population constituted a basic stratum by itself except in Gujarat and Arunachal Pradesh where some districts with less than the above population were divided into two or more basic strata. Districts having more than 1.5 million rural population were divided into a number of basic strata (depending upon the population) by grouping contiguous tehsils similar with respect to crop pattern and density of rural population. Generally, each urban stratum was a district or a group of districts within the same region excepting the districts of Ahmedabad, Bangalore and Kanpur. In each of these cases, the district was divided into two strata, the city itself making up one stratum and the rest of the urban areas the other. With this arrangement, each city with 1971 census population above 1 million of this category were, constituted a separate stratum. (The remaining cities/being whole districts. Those cities were Bombay, Calcutta, Delhi, Hyderabad and Madras. The total number of rural and urban strata were 497 and 363 respectively.

3.1.3 Allocation : The state level allocations were determined on the basis of their investigator strength available and the expected work load per investigator. These were further allocated to strata in proportion to the total number of 1981 census. House-listing blocks in rural sector and the total number of blocks in the frame in urban sector (in the case of Assam, rural allocation was proportional to 1971 census rural population). These were adjusted to the field strength of each sub-region. Final stratum level allocations were rounded off to multiples of two.

3.1.4 Sampling of villages : The sample villages were selected with probability proportional to number of House-listing blocks and with replacement. In the case of villages selected from 1971 census frame, sample villages were selected with probability proportional to size and with replacement where size was related to 1971 census population. Selection was done in the form of two independent sub-samples.

3.1.5 Revenue village selection : When the sampled census village was not identifiable, one of the following procedures was adopted according to the situation : (a) all revenue villages contained wholly or partly in the census village were surveyed as one unit, or (b) the revenue village which contained the selected census village and possibly other census villages was wholly surveyed.

3.1.6 Sampling of blocks : The urban frame survey (UFS) blocks of UFS - 1977 scheme wherever available and UFS blocks of 1972-77 period for the remaining towns and 1981 census frame in case of new towns constituted the sampling frame for selection of blocks. In each urban stratum sample blocks were selected by simple random sampling without replacement in the form of two independent sub-samples.

3.1.7 Hanlet-group and sub-block selection : In case the present population of a sample village or block was 1200 or more, it was divided into two or more equal (in terms of population) sub-divisions (called hanlet groups in the case of villages and sub-blocks in the case of urban blocks), the number of sub-divisions depending on the population of the village or block at the time of the investigator's visit. One of them was selected at random for survey.

3.1.8 Sampling of households (rural) : The households of each sample villages were divided into four sub-strata, by their area of land possessed. Households possessing less than 0.05 acres formed sub-stratum 1. The remaining households were ranked first by their area of land possessed and then divided into three sub-strata by determining two boundary points A and B for each village such that the total area of land possessed was nearly the same for each sub-stratum (households with land possessed : (i) from 0.05 to A (ii) A to B and (iii) above B constituted respectively sub-stratum 2,3 and 4). Two households were selected from each sub-stratum circular systematically with a random start. The households of sub-stratum 1 were arranged by their means of livelihood (agricultural labour, artisan and others) before sample selection.

3.1.9 Sampling of households (urban) : The households of a sample block were divided into three sub-strata by their monthly per capita expenditure. The boundary points for them were fixed at state level. Two households were selected circular systematically in each sub-stratum. In both rural and urban sectors, the same sample households were surveyed in both the visits.

### 3.2 Estimation Procedure

#### 3.2.1 Notations :

s	:	subscript for sth stratum
t	:	subscript for t-th sub-stratum (within a village/block)
i	:	subscript for ith sample village/block
j	:	subscript for j-th sample household
$I$	:	total number of rural/urban strata in the state
z	:	village size (used for sampling)
Z	:	total size of a rural stratum
N	:	total number of blocks in an urban stratum
D	:	number of hamlet-groups/sub-blocks formed
m	:	number of surveyed villages/blocks including depopulated and zero cases
H	:	total number of households in a sub-stratum
h	:	number of surveyed households in a sub-stratum
f	:	adjustment factor for survey of a revenue village
y	:	value of characteristic
Y	:	total of y at the state level
$\hat{Y}$	:	estimate of Y from the sample

The expressions for  $\hat{Y}$  are given in the next para.

Contd.....

3.2.2 Rural sector :

$$\hat{Y} = \sum_{s=1}^L \frac{Z_s}{m} \sum_{i=1}^{m_s} \frac{D_{si}}{f_{si} z_{si}} \sum_{t=1}^4 \frac{H_{sit}}{h_{sit}} \sum_{j=1}^{h_{sit}} y_{sitj}$$

Where  $H_{sit}$  was the total number of households in the  $t$ -th sub-stratum of the village and  $h_{sit}$  was the corresponding number of surveyed households available for tabulation.

3.2.3 Urban sector :

$$\hat{Y} = \sum_{s=1}^L \frac{N_s}{m} \sum_{i=1}^{L_s} D_{si} \sum_{t=1}^3 \frac{H_{sit}}{h_{sit}} \sum_{j=1}^{h_{sit}} y_{sitj}$$

3.2.4 Estimates in respect of joint operational holdings : In the case of joint operational holdings operated by the sample household jointly with other household(s); the value of a characteristic of the operational holding was first divided by the number of partner households to get the sample household's share and then the higher level estimates were built up.

3.2.5 Estimates of ratios : Let  $Y$  and  $X$  be the totals of the characteristics  $y$  and  $x$  at the state/all-India level. Then the estimates of the ratio  $R = Y/X$  as obtained as  $\hat{R} = \frac{\hat{Y}}{\hat{X}}$  where  $\hat{Y}$  and  $\hat{X}$  unbiased estimates of  $Y$  and  $X$  respectively.

3.2.6 Sub-sample-wise estimates : Sub-sample-wise estimates were computed on the basis of villages and blocks surveyed in the concerned sub-sample. Thus,  $m_s$  in the above formula would mean the number of surveyed villages/blocks in the concerned sub-sample of the  $s$ -th stratum. The combined estimate of the stratum total based on the whole sample was computed as the weighted mean of the sub-sample-wise estimates. The combined estimate of the state (or all-India) total of the characteristic was obtained as the estimates of relevant stratum totals. However, the combined estimate of a ratio was calculated as the ratio of the combined estimates of numerator and denominator at the state/all-India level.

3.2.7 Participation of states : All the states and Union Territories except Sikkim, Andaman & Nicobar Islands, Chandigarh, Dadra & Nagar Haveli and Lakshadweep participated in the 37th round survey on at least an equal matching basis, some of the states and u.t.'s had more than equal matching samples.
