NATIONAL SAMPLE SURVEY ORGANISATION  
THIRTYNINTH ROUND : JANUARY - JUNE 1984

NUMBER 301  
AND  
POPULATION BIRTH AND DEATH RATES

SECTION ONE

I N T R O D U C T I O N

1.1 According to the NSS Programme, an enquiry on population, births and deaths was conducted in the 39th round (January-June 1984) of NSS, after an interval of nearly ten years. The NSS this time preferred the survey to be conducted by the enumeration and re-enumeration method which would ensure netting most of the events of births and deaths <sup>1/</sup>. In addition, the method of direct enquiry for collecting information on births and deaths had also been adopted to derive an independent estimate of the vital rates. Consequently, two schedules were canvassed - schedule 12 for enumeration of population as on the date of survey and enumeration of births and deaths occurring during the preceding two years; and schedule 12.1 for re-enumeration of population, enumeration of births and deaths occurring to household members enlisted in the previous survey, conducted about a year back, and to elicit certain information on fertility.

1.2 Schedule 12.1 - Population, births and deaths enumeration & re-enumeration : The population survey in the 39th round was carried out in a sub-sample of the villages and blocks surveyed in the first and second sub-rounds (January-June 1983) of the 38th round. The

---

1/ The enumeration and re-enumeration method yielded very good results in the NSS 14th round (1958-59). The population growth rate derived from the survey data was considerably higher than that being officially used during the decade of fifties (1.9% as against the official estimate of 1.3). The NSS rates turned out to be very close to the intercensal average annual rate of population growth between 1951 and 1961.

schedule of enquiry, schedule 12.1, was split into two parts. Information collected with respect to members of the households, where the schedule on employment and unemployment was canvassed during the first and second sub-rounds of the 38th round served as the basic list of households and persons, form the re-enumeration part of the schedule (Part-I). In Part-II, all the events of births and deaths occurring to household members enlisted at the time of first enumeration (January - June 1983), during the intervening period between the date of enumeration (1983) and the date of re-enumeration (1984), were recorded. Information on total fertility was also collected from the ever married female members of the sample households, at the time of re-enumeration. In general all the ten households surveyed in a sample village/block in the first half of 1983 were revisited in 1984 for canvassing the schedule 12.1.

1.3 Schedule 12 - Population, births and deaths enumeration : All the households in the villages and urban blocks, resurveyed in 1984, were listed once again during the second visit also. While listing a household at the second visit, it was ascertained whether that was a sample for detailed enquiry in the first visit. Those households which were surveyed in 1983 were selected for canvassing the schedule 12.1 as has already been mentioned. In each of the remaining households, a short schedule viz. population, births and deaths enumeration (schedule 12) was canvassed to collect information on vital events, occurring during the previous two years in the household, by direct enquiry.

1.4 Thus the survey data of NSS 39th round provided two independent sets of estimates of births and deaths - one is (from schedule 12.1) derived by investigating the reported change in the membership composition of household between two points of time that is, by identifying those who became new members by birth after the first visit and those enumerated as members in the first visit but ceased to be so in the later visit by death; and the other set (from schedule 12) obtained by direct enquiry.

## SECTION TWO

### SCOPE, COVERAGE AND SAMPLE DESIGN

2.1 Geographical coverage : The survey covered the whole of the Indian Union excepting (i) Ladakh and Kargil districts of Jammu & Kashmir and (ii) rural areas of Nagaland.

2.2 Sample design : This survey on population, births and death as stated earlier was carried out in the 39th round in a sub-sample of surveyed sample villages and blocks of the first and second sub-rounds of the 38th round. Hence the sample design for the 39th round was the same as that of 38th round.

2.3 The basic design for the survey was a two stage stratified design. The first stage units (f.s.u.'s) were census villages in the rural sector and urban blocks (urban frame survey) in the urban sector. The second stage units were households in both the sectors.

2.4 Selection of f.s.u.'s : The sample villages were selected with probability proportional to size (population) with replacement, in the form of two independent interpenetrating sub-samples (IPNS) in the 38th round of NSS for employment and unemployment survey. Sample blocks were selected with equal probability, also in the form of two IPNS's. A sub-sample of sample villages/blocks of the first and second sub-rounds of 38th round formed the first stage units of NSS 39th round.

2.5 Selection of second stage unit (households) : A sample of 10 households were selected circular systematically from each sample village/block of first and second sub-rounds of 38th round for the employment and un-employment survey after arranging all the households in a specified manner. In case the total number of households in a sample village/block were 10 or less, all the households were included in the sample. The same set of sample households surveyed for employment and unemployment survey in the 38th round were surveyed for schedule 12.1 in the 39th round. All the residual households found existing during the 39th round survey constituted the sample for schedule 12.

2.6 The rural/urban allocations of first stage units in a state/U.T. considering the relative sizes of rural and urban population were further allocated to the constituent rural/urban strata in proportion to the rural/urban population. The stratum-level allocations were rounded off to multiples of two. A final adjustment was made to ensure that the samples allocated to each ZOD Region matched with its net investigator strength. The final strata-wise allocations thus determined, added up gave U.T./state/all India sample size for the central sample. The number of sample villages and urban blocks allotted and surveyed alongwith the households surveyed in schedules 12.1 and 12 in the central sample\* for NSS 39th round is given in table 2.1.

## Section Three

### CONCEPTS AND DEFINITIONS

3.1 In the 39th round, as mentioned earlier, two schedules, namely, schedule 12.1 and schedule 12, were canvassed in the sample villages and urban blocks which were surveyed in the first and second sub-rounds of the 38th round. The schedule 12.1 was canvassed in the same sample households where schedule 10 was canvassed in the 38th round and in the remaining households of the sample village and urban block, schedule 12 was canvassed.

3.2 The schedule 12.1 was split into two parts, namely, Part-I and Part-II. In Part-I, list of household members, the particulars of members of the sample households were copied from schedule 10 of the 38th round, formed the enumerated population of the sample households. The Part-I of the schedule 12.1 was updated during the 39th round survey by reenumeration. In this part, increase or decrease of household members were noted during reenumeration. Information on births and deaths occurring to the sample household since the time of enumeration was recorded in Part-II of the schedule 12.1.

3.3 In the intervening period between the listing done in the 38th round and updating of the listing in the 39th round survey, a household listed in the 38th round (including a sample household for which Part-I of schedule 12.1 was filled up) (i) might have undergone partition, (ii) might have merged into one or more households, (iii) might have become non-existent on account of death or migration of all members of the household or (iv) might not have been affected by any such situation mentioned above in (i) to (iii).

3.4 In the case of partition of a sample household, one splinter household existing at the time of first visit and revisit and the other splinters (household) which were existing as separate households in the sampled areal unit were surveyed in one schedule 12.1 while the members of the original household that left the sampled areal unit were considered as out migrants.

3.5 In the case of merger of two or more sample households, all such sample households were surveyed in separate schedules 12.1. If a sample household was merged with a non-sample household, both the households were surveyed in one schedule and the members of the non-sample household were recorded as in-migrants.

3.6 For the extinct (through death of all members) sample households, the schedule 12.1 was canvassed and the particulars of births and deaths of that household were collected from the neighbours.

3.7 For sample households that left the sampled areal unit, the schedule 12.1 was filled in on the basis of information supplied by the neighbours. The members of the sample household were accounted for as the case of out-migration.

3.8 The schedule 12 was canvassed in the remaining households of the sample village and urban block where schedule 12.1 was not canvassed. The information on births and deaths that occurred during the last two years preceding the date of survey was recorded. Thus, the survey covered all the households in the sample village and urban block either by the schedule 12.1 or schedule 12.

3.9 Birth and death rates : The number of births and deaths that occurred during the intervening period were taken into account for calculation of annual vital rates for schedule 12.1 while the births and deaths that occurred during 365 days preceding the date of survey were taken into account for calculation of annual vital ~~events~~ <sup>rates</sup> for schedule 12.

3.10 Infant mortality rate : This relates to the number of children dying before attaining one year of life to the total number of children born alive during a period of 365 days.

JR.

alive.

3.11 Age specific fertility rate : It is estimated by relating the total number of live births occurring to the women of specified age-group to the total number of women of that age-group,

3.12 Age at effective marriage : The effective marriage of ~~husband~~<sup>husband</sup> and wife is reckoned to start when they begin to live together. In case of women married more than once, the age at effective marriage for the first marriage is taken into account.

3.13 Average age of mother who had child birth (live births) : It is obtained by relating estimated aggregate of ages of mothers who had child birth (live births) to the estimated number of mothers having child birth (live births).

---

Section Four

NOTES ON TABLES

4.1 The detailed tables presented in this report are either obtained from the data collected in the schedule 12.1 or schedule 12. The informations collected, through schedule 12.1, are by the enumeration and re-enumeration method and through schedule 12 by direct enquiry. The indication of enumeration and re-enumeration method or of direct enquiry has been made in the headings of the tables.

4.2 Average household size : This is the ratio of estimated total population to the estimated number of households. The estimated total population, in schedule 12.1, relates to the population on the day of re-enumeration and the estimated number of households include the estimated number of households listed in the first visit and existing in the re-visit, the estimated number of partitioned households emerging out of sample household and residing within the sample areal unit on the day of re-visit, the estimated number of households which became extinct in the re-visit through merger with other households listed in the first visit, and the estimated number of households that left the sample areal unit but were residing within the same sample village/block.

4.3 Sex ratio : This relates to the estimated total number of women per 1000 men. For schedule 12.1, the ratio is based on the estimated number of women and men as on the day of re-enumeration.

4.4 In planning the survey of schedule 12.1, it was targetted that the re-enumeration of each sample village/block is to be done on a day nearly 365 days ~~at~~ <sup>after</sup> the date of enumeration to net the vital events occurring in an interval of one year. In practice, however, the target fell short in many cases leaving the gap between enumeration and re-enumeration sometimes more and sometimes less than 365 days. This has necessitated adjustment of the base population for one year, used for calculating the vital rates, viz. birth rates, death rates and age specific fertility and mortality rates. The adjustment factor applied is :

average number of days between enumeration and re-enumeration  
for sample households in the sample village/block

4.5 Birth rate : The base population used for calculation of birth rate from schedule 12.4 is the simple average of the population on the day of enumeration and re-enumeration.

4.6 Age specific fertility rate : In deriving the age specific fertility rate from schedule 12.1, the births that occurred to the women who were members on the day of enumeration and reported not alive on the day of re-enumeration has not been taken into account in the estimated births.

4.7 Death rate : The population, for calculation of death rate from schedule 12.1, exposed to risk is the estimated population on the day of enumeration. This has been adjusted by adding half of the estimated number of live births during the intervening period of enumeration and re-enumeration and subtracting half of the estimated population, who were not members on the day of re-enumeration and it was not known whether the members were alive or dead, of the households that left the village/block. This is again adjusted by subtracting half of the estimated population, who were not members on the day of re-enumeration due to the reason other than death, of the households that left the sample village/block.

4.8 Age specific mortality ratio for '0' year : This is obtained by taking the ratio of the estimated number of deaths (at age '0' years) which occurred during the 365 days preceding the date of survey to the estimated number of live births that occurred during the 365 days preceding the date of survey reduced by the estimated number of infants born alive during the 365 days preceding the date of survey but not alive on the date of survey.

4.9 The sample number of events may not agree in all the tables. The characteristics, on which the different tables has been generated, were missing in the records of the sample events in a few cases and hence, such records were kept aside of the tabulation in that table.

Section Five

SUMMARY OF FINDINGS

5.1 The 39th round survey on population, births and deaths was carried out in 3465 sample villages and 1797 sample blocks for schedule 12.1. Out of those samples, data on schedule 12 relating to 3322 sample villages and 1708 sample blocks have been used for tabulation. The survey results show that the population composition of rural and urban sectors of all-India is in the ratio of 78 : 22. The sex ratio (females per 1000males) is 960 in the rural sector and 914 in the urban sector.

5.2 Proportion of rural and urban population : The distribution of population and households over the states for rural and urban sector comes out to be almost the same from the schedules 12.1 and 12. The composition of population and households in the states for rural and urban sectors are also similar. In tables 5.1A & 5.1B, it is found that the percentage share of rural population is the highest for Uttar Pradesh followed by Bihar and Andhra Pradesh whereas the percentage share of urban population is the highest for Maharashtra followed by Uttar Pradesh and Tamil Nadu.

5.3 Household size : The proportion of single member households is more in the urban sector than in the rural sector of all-India. The average household sizes are 5.44 and 5.04 for rural and urban sectors respectively. The distribution of households by household size is shown in table 5.2.

5.4 Proportion of female-headed households : The percentage of female-headed households gradually decreases as the size of the households increases. This trend can be observed from table 5.3. It is found that the percentage of female-headed households is higher in the rural sector than that in the urban sector of all-India.

JR.

	sch. 12	19.12	15.38	9.52	5.57	4.50	4.67	8.68	

5.5 The percentage of female-headed households in different states, as observed from tables 5.4R & 5.4U, indicates that Lakshadweep has the highest percentage of female-headed households; followed by Goa, Daman & Diu, Meghalaya and Kerala in the rural sector. Although, in the urban sector, the ranking of these four states with respect to their proportion of female-headed households is a little bit different where Meghalaya has the highest proportion followed by Goa, Daman & Diu; Lakshadweep and Kerala, both in the rural and the urban sector, the female-headed households in those four states is perceptibly higher. This is perhaps due to the predominance of population belonging to matriarchal society in those states. The average household size of female-headed households are higher in the rural sector of Lakshadweep and Chandigarh and in the urban sector of Lakshadweep, Meghalaya and Sikkim. In other states, the average household size of male-headed households is higher than the female-headed households.

5.6 The distribution of population by age and sex for rural and urban sectors of all-India are given in tables 5.5R & 5.5U respectively. The important feature, revealed from the data of both the schedules, is that the proportion of population in the age-group (0-4) years is less than the proportion of population in the age-group (5-9) years for either sex in the rural and urban sectors of all-India. It could be observed also that the difference in the percentage share of population in these two age brackets are little more in the rural sector than in the urban sector of all-India. The aged population (60 years or more) claims a larger share in the rural sector than that in the urban sector.

5.7 Distribution of population/marital status <sup>by</sup> : It is observed, in table 5.6, that the proportions of never-married males and females are little higher in the urban sector than those in the rural sector of all-India. The proportion of currently married males and females; and widowed, divorced and separated males are higher in the rural sector. It is also noted that the proportion of widowed, divorced and separated females is higher compared to the males and this is so in both the rural and the urban sectors.

TABLE (5.4R) : PERCENTAGE OF FEMALE-HEADED HOUSEHOLDS AND AVERAGE HOUSEHOLD SIZE OF MALE-HEADED AND FEMALE-HEADED HOUSEHOLDS OBTAINED BY ENUMERATION & RE-ENUMERATION (SCH. 12.1) AND DIRECT ENQUIRY (SCH. 12) FOR EACH STATE/U.T.

3. widowed, divorced and separated	33	89	61	23	90	55
4. all status	1000	1000	1000	1000	1000	1000

5.8 Rate of literacy : The proportion of illiterate among females are more than males in both the rural and urban sectors of all-India and it is predominantly high in the rural sector. About 701 (per 1000) female in the rural sector are illiterate compared to 481 (per 1000) females in the urban sector. The proportion of persons having educational standard 'secondary and above' are higher in the urban than in the rural and it is again higher for males. The proportion of illiterate population and the literate population by their levels of education are shown in Table (5.7).

TABLE (5.7) : DISTRIBUTION (PER 1000) OF MALES/FEMALES/PERSONS BY EDUCATIONAL STANDARD FOR RURAL AND URBAN SECTORS OF ALL-INDIA : DIRECT ENQUIRY

educational standard	rural			urban		
	male	female	person	male	female	person

5. all standards	1000	1000	1000	1000	1000	1000

5.9 Age at effective marriage : Table 5.8 gives the average age at effective marriage of ever-married males of (15-59) years and females of (15-49) years. The average age at effective marriage of males is observed to be 21.25 years in the rural and 22.89 years in the urban sector. While for females, it is 16.87 years and 17.77 years for the rural and the urban sectors respectively. Both for males and females the average age at effective marriage are higher in the urban than that in the rural sector.

TABLE (5.8) : AVERAGE AGE AT EFFECTIVE MARRIAGE BY DIFFERENT AGE GROUPS OF EVER-MARRIED MALES OF (15-59) YEARS AND FEMALES OF (15-49) YEARS FOR RURAL AND URBAN SECTIONS OF ALL-INDIA : DIRECT ENQUIRY

age-group (years) of ever-married	rural		urban	
	male	female	male	female
(1)	(2)	(3)	(4)	(5)
15 - 19	10.51	15.57	16.78	15.89
20 - 24	19.13	16.87	19.76	17.59
25 - 29	20.74	17.20	21.95	18.23
30 - 29	20.11	17.03	21.28	17.93
30 - 34	21.45	17.05	23.15	18.12
35 - 39	21.89	16.98	23.49	17.86
30 - 39	21.45	17.02	23.31	18.00
40 - 49	21.97	16.90	23.53	17.66
15 - 49	-	16.87	-	17.77
50 - 59	22.03	-	23.54	-
15 - 59	21.25	-	22.89	-

5.10 Interval since last child birth : The distribution (per 1000) of currently married women aged 15-49 years with at least one child birth, in table 5.9, reveals that the proportion of women who have passed 5 years or more since the last child birth are 361 (per 1000) in the rural sector and 440 (per 1000) in the urban sector. The proportion of women who gave birth to a child within 365 day before the date of enquiry is 178 (per 1000) in the rural sector and is higher than 169 (per 1000) in the urban sector.

TABLE (5.9) : DISTRIBUTION (PER 1000) OF CURRENTLY MARRIED WOMEN AGED 15-49 YEARS WITH AT LEAST ONE CHILD BIRTH BY PERIOD SINCE LAST CHILD BIRTH FOR RURAL AND URBAN SECTORS OF ALL-INDIA : DIRECT ENQUIRY

s e c t o r	Period since last birth (years)					
	less than one year	1 - 2	2 - 3	3 - 5	5 & more	all periods
(1)	(2)	(3)	(4)	(5)	(6)	(7)
r u r a l	178	136	140	184	361	1000
u r b a n	160	127	114	159	440	1000

5.11 Birth rate : The birth rates, obtained by enumeration & re-enumeration and direct enquiry, are very close to each other at the all-India level. It is observed, in table 5.10, that the birth rates, obtained by enumeration & re-enumeration, are 29 and 24 respectively for rural and urban sectors of all-India. These rates, obtained by direct enquiry, are 28 and 25 respectively for rural and urban sectors. The birth rates are higher in the rural sector than in the urban sector. In the rural sector of the Central Zone, the birth rate is the highest (32) and it is the lowest in the North-Eastern Zone (24); it is also low in the South Zone (25).

TABLE (5.10) : BIRTH RATE OBTAINED BY ENUMERATION & RE-ENUMERATION (SCH. 12.1) AND DIRECT ENQUIRY (SCH. 12) FOR RURAL AND URBAN SECTORS OF EACH ZONE AND ALL-INDIA

- \*Zone : 1) Andhra Pradesh, Karnataka, Kerala, Tamil Nadu and Pondicherry.  
 2) Maharashtra, Gujarat, Dadra Nagar Haveli and Goa, Daman & Diu  
 3) Punjab, Haryana, Delhi, Chandigarh, Himachal Pradesh and Jammu & Kashmir.  
 4) Uttar Pradesh, Madhya Pradesh, Rajasthan and Bihar  
 5) Assam, West Bengal, Orissa and Andaman & Nicobar Island.  
 6) Tripura, Manipur, Mizoram, Meghalaya, Nagaland, Arunachal Pradesh, Sikkim and Lakshadweep.

5.12 Age specific fertility rate : The age specific Fertility rates, obtained by schedule 12.1 and schedule 12, are nearly of the same order. It is observed to be 121 and 125 in the rural and 97 and 103 in the urban sector of all-India obtained from schedule 12.1 and schedule 12 respectively. The age specific fertility rate has attained maximum in the age group of (20-24) years and this rate remains considerably high in the following two age groups of (25-29) years and (30-34) years. Thereafter, it takes a sharp decline over the successive quinquennial age groups. The age specific fertility rate is low in the urban compared to rural sector for all the age-groups. These rates are given in table 5.11.

TABLE (5.11) : AGE SPECIFIC FERTILITY RATE OBTAINED BY ENUMERATION & RE-ENUMERATION (SCH. 12.1) AND DIRECT ENQUIRY (SCH. 12) FOR RURAL AND URBAN SECTORS OF ALL-INDIA

age-group (years)	rural		urban	
	sch.12.1	sch. 12	sch.12.1	sch. 12

15 - 19	74	66	48	44
20 - 24	219	217	192	191
25 - 29	207	203	174	185
30 - 34	125	144	100	111
35 - 39	81	87	54	55
40 - 44	40	43	23	22
45 - 49	15	17	7	9
15 - 49	121	125	97	103
no. of sample births	4869	56178	1869	22852

5.13 Educational level and fertility : It appears from table 5.12 that the age specific fertility rate decreased gradually as the educational level of the women increase, excepting for the women of educational standard 'literate but below primary' in the rural sector. The difference with the next higher level of education, however, is very marginal.

TABLE (5.12) : AGE SPECIFIC FERTILITY RATE BY EDUCATIONAL STANDARD OF WOMEN FOR RURAL AND URBAN SECTORS OF ALL-INDIA : ENUMERATION & RE-ENUMERATION

age group (years)	r u r a l				u r b a n			
	educational standard				educational standard			
	not literate	literate but below primary	primary & middle	secondary & above	not literate	literate but below primary	primary or middle	secondary & above

no. of sample births	3866	575	198	109	1351	388	64	31

5.15 Place of birth : In the rural sector, 765 (per 1000) births took place in the parent's residence of the women and it was 453 (per 1000) in the urban sector. Only a few, 97 (per 1000), births, took place in the hospital/PHC/maternity home in the rural sector whereas 415 (per 1000) births took place in the hospital/PHC/maternity home in the urban sector. The distribution of live births by place of birth is given in table 5.14.

TABLE (5.14) : DISTRIBUTION (PER 1000) OF LIVE BIRTHS BY PLACE OF BIRTH FOR RURAL AND URBAN SECTORS OF ALL-INDIA : ENUMERATION & RE-ENUMERATION

s e c t o r	p l a c e o f b i r t h					
	parent's residence	relation's residence	hospital/PHC/maternity home	outside the country	other place within the country	all places of birth
(1)	(2)	(3)	(4)	(5)	(6)	(7)
r u r a l	765	55	97	-	83	1000
u r b a n	453	46	415	-	86	1000

5.16 Antenatal medical care : It is observed from table 5.15 that neither a medical nor a para-medical person attended for 556 (per 1000) live births in the rural sector and 316 (per 1000) live births in the urban sector. The govt. doctor attended only 58 (per 1000) live births in the rural sector. This was considerably lower compared to 230 (per 1000) live births which were attend by medical person in the urban sector.

TABLE (5.15) : DISTRIBUTION (PER 1000) OF LIVE BIRTHS BY ATTENDANCE TYPE FOR RURAL AND URBAN SECTORS OF ALL-INDIA : ENUMERATION & RE-ENUMERATION

s e c t o r	a t t e n d a n c e t y p e					
	govt. doctor	other doctor	govt. nurse/midwife	other nurse/midwife	neither medical nor para-medical person	all types of attendance
(1)	(2)	(3)	(4)	(5)	(6)	(7)
r u r a l	58	61	51	274	556	1000
u r b a n	230	18	74	202	316	1000

5.17 In table 5.16, it is observed that the proportion of live births for which the medical/para-medical persons attended before and after delivery are considerably higher in the urban sector. Among them, the service of the medical/para-medical persons was reported to be satisfactory in most cases in both the rural and the urban sectors.

TABLE (5.16) : PROPORTION (PER 1000) OF LIVE BIRTHS ATTENDED BY MEDICAL/PARA-MEDICAL PERSONS AND AMONG THE ATTENDED BIRTHS, THE PROPORTION (PER 1000) FOR WHICH THE SERVICE WAS SATISFACTORY, SEPARATELY FOR ANTENATAL AND POST-NATAL STAGE FOR RURAL AND URBAN SECTORS OF ALL-INDIA : ENUMERATION & RE-ENUMERATION

s e c t o r	proportion attended by medical/ para-medical persons		proportion for which service was satisfactory	
	before delivery	after delivery	before delivery	after delivery
(1)	(2)	(3)	(4)	(5)
r	354	337	851	849
u r b a n	593	564	963	948

5.18 Reason for not seeking medical assistance It is revealed from table 5.17 that most of the informants among those who did not seek assistance of medical/para-medical persons at antenatal and post-natal stages of live births, did not do so because of their lack of faith in it though, medical facilities were available in the neighbourhood. Only in few cases non-availability of medical facilities in the neighbourhood was reported.

5.19 Average age of mothers at child birth during year The average age of mother who had child birth (live births) during the intervening period is found to be 26 years for the rural as well as the urban sector at all-India level.

5.20 Death rate The death rates, in the rural sector, obtained by enumeration & re-enumeration and direct enquiry are 11 and 8 respectively and in the urban sector of all-India, the rates are 8 and 5 respectively. Of the six zones, the Central Zone has the highest and the North-Eastern Zone has the lowest death rate. Compared to the urban sector, the death rates are observed to be higher in the rural sector. The death rates by zones are presented in table 5.18

TABLE (5.17) : DISTRIBUTION (PER 1000) OF LIVE BIRTHS FOR WHICH NO SERVICE OF MEDICAL/PARA-MEDICAL PERSONS WAS SOUGHT BY REASONS FOR NOT SEEKING THE SERVICE, SEPARATELY FOR ANTE-NATAL AND POST-NATAL STAGE FOR RURAL AND URBAN SECTORS OF ALL-INDIA :  
ENUMERATION RE-ENUMERATION

5.21 Age specific death rate : In table 5.19, the infant death rates (at age '0') are observed to be, obtained from sch. 12.1 and sch. 12, 101 and 75 respectively in the rural, and 83 and 48 in the urban sector. At the old age (70 & above), the death rate is higher in the rural sector than in the urban sector.

urban	559	119	-	-	322	1000

5.23 An overview of the survey results : The birth rate and death rate derived from survey data are shown for different zones of the country, separately for rural and urban areas, in tables 5.10 and 5.18. On the basis of these results, the rate of natural increase of population per year is estimated at 1.3 percent for rural and 1.6 percent for urban from the enumeration and re-enumeration method of enquiry. While the birth rates for the rural and urban areas are almost of the same order, for the two types of enquiry namely, enumeration and re-enumeration method and the method of direct retrospective enquiry, the death rate obtained from the second method is substantially lower than that obtained from <sup>the</sup> first method. In general, under-reporting of birth and death events is known to be a not too infrequent phenomenon in a retrospective enquiry. It is also known that in such an enquiry relatively more events of death are missed compared to the missing of birth events. Through NSS experience it has also been found that the enumeration and re-enumeration method of

enquiry is a satisfactory procedure to minimise the possibility of omission of vital events. The closeness of the estimates derived independently from the two survey data suggests that the extent of omission of birth by retrospective enquiry was negligibly small in NSS 39th round. The survey results, on the other hand, strongly suggest superiority of the enumeration and re-enumeration method estimating death rate.

5.24 Rate of natural increase : The rate of ~~natural~~ increase, that is, the excess of birth rate over death rate is of the order of 1.8 and 1.6 for the rural and urban areas respectively. These rates of natural increase derived from the data of enumeration and re-enumeration method of enquiry is considerably lower than the average annual inter censal rate of growth of population between 1971-81. At all-India level, the SRS estimate of death rate of 8 per thousand, over the years 1982-84 for the urban areas is the same as that obtained from the NSS enumeration and re-enumeration survey. The corresponding rate from SRS for all-India rural is 13 per thousand which is 2 points higher than the NSS estimates. The NSS estimate of birth-rates is, however, lower than the SRS estimate

5.25 Population age structure : The proportion of population in the first three quinquennial age group is shown in table (5.21) for the last three ~~decennial~~ <sup>decennial</sup> censuses and the NSS 32nd (1977-78) and NSS 39th (1984) rounds. It is apparent from the table that the proportion of population below 10 years of age tends to decline over time. In the decade 1961-71, the decline is more marked in the age-group 0-4 than in the next 5 year age-group. This observation suggests that there was a fertility decline in the second half of the decade of sixties. It is also observed from the age distribution that the declining tendency of fertility continued over the next decade as well. The gradual fall of the proportion of population in the age-group (0-4) years from 1971 to 1977-78 and from 1977-78 to 1981 is indicative of steady decline in fertility through the whole decade of seventies. Almost the steady birth-rate of 33 per thousand given in the SRS report <sup>2/</sup> does not

seem to be compatible with the gradual decline of the proportion of population at early ages during the 1971-81 decade. The three yearly moving average birth rate of 33.1 for 1977-79 which rose to 33.8 for the triannium 1979-81 as reported in SRS Bulletin is also against the decline in the observed proportion of population below 5 years of age in NSS 1977-78 and the population/census of 1981. There might, however, have been a slight increase in the birth rate after 1981.

Table (5.21) : Proportion of population in early age-groups as enumerated in the last three decennial censuses and as estimated in the NSS 32nd (1977-78) and 39th (1984) rounds.

age group (year)	Percentage of population to total population				
	census 1961*	census 1971*	NSS 1977-78	census 1981*	NSS 1984
(1)	(2)	(3)	(4)	(5)	(6)
0 - 4	15.06	14.51	13.44	12.59	12.79

10 - 14	11.23	12.55	-	12.88	12.39
5 - 14	25.96	27.51	27.56	26.95	26.61
0 - 14	41.02	42.02	41.00	39.54	39.40

\* Census of India 1981, Part II - Special, Statement 3, pp-26.

5.26 Change in death rate and its likely effect on age structure

The death rate shown by the SRS maintained a steady rate of decline from 15.9 per thousand in 1971-73 to 12.1 per thousand in 1983-85. That is to say, the death rate has reduced by about 25 per cent within a period of fifteen years. Till now the population age structure of India has a broader base in the lower age group. By proportion the population in the older ages is small. A decline in the overall death rate will, therefore, be the result of a similar decline in the infant and toddler death rates. Thus, even if the birth rate remains constant, the decline in death rates may slightly raise the proportion of population of early ages. Against this the observed gradual decline of the proportion of population in the age-group (0 - 4) <sup>years</sup> over a fairly long period of more than 20 years is a definite indication of a faster rate of decline in birth rate than what is indicated in the series of rates provided by SRS. Under these circumstances the vital rates obtained from NSS survey data, may not perhaps be very different from the true values.

## Appendix-I

## LIST OF DETAILED TABLES

	t i t l e	page no(s).
	(2)	(3)
	Distribution of estimated households (per 1000 extant on the day of re-enumeration) by sex of the head of the household and household size and percentage of female - headed households by household size.	A.5 - A.10
2J	-do-	A.11-A.16
3R	Distribution (per 1000) of males/females/persons (member of sample households on the day of re-enumeration) by age and marital status.	A.17-A.46
4U	-do-	A.47-A.70
5R	Distribution (per 1000) of males by educational standard for each state/u.t. : direct enquiry.	A.77
6U	-do-	A.78
7R	Distribution (per 1000) of females by educational standard for each state/u.t. : direct enquiry.	A.79
8U	-do-	A.80

In numbering the tables, the system of multiple coding has been used. The number '1', appearing before the decimal in the number of the tables indicates that the respective tables relate to the household characteristics and number '2' before decimal indicates that the tables relate to the characteristics of population. The numbers '3' and '4' before decimal in the number of the tables are used to indicate the tables on the births and deaths respectively. The running serial numbers are followed, starting from '1', after the decimal in the table numbers. At the right most position of the table numbers, 'R', 'U' or 'C' indicate the sector, i.e. rural, urban, or combined (rural and urban).

(1)	3	
2.9R	Distribution (per 1000) of persons by educational standard for each state/u.t. : direct enquiry	A.81
2.10U	-do-	A.82
3.11C	Distribution (per 1000) of males/females/persons (member of sample households on the day of re-enumeration) and sex-ratio by age for rural and urban sectors of each state/u.t.	A.83-A.
3.12R	Average age at effective marriage by different age-groups of ever-married males of (15-59) years for each state/u.t. : direct enquiry.	A.114
3.13U	-do-	A.115
3.14R	Average age at effective marriage by different age groups of ever-married females of (15-49) years for each state/u.t. : direct enquiry.	A.116
3.15U	-do-	A.11
3.16R	Distribution (per 1000) of currently married women aged (15-49) years with at least one child birth by age and period since last birth for each state/u.t. : direct enquiry.	A.118-A
3.17U	-do-	A.133-A.1
4.18C	Birth rate obtained by enumeration & re-enumeration and direct enquiry for rural and urban sectors of each state/u.t.	A.14g
4.19R	Age specific fertility rate obtained by enumeration & re-enumeration and direct enquiry for each zones and all-India.	A.149

Appendix-II  
ESTIMATION PROCEDURE

- A.1 Notation : The following notations are used in the sequel :-
- S : subscript for state/union territory
  - r : subscript for region
  - s : subscript for stratum
  - i : subscript for sample village/block
  - j : subscript for sample household
  - P : total frame population in rural sector (used for selection)
  - p : population of sample village (used for selection)
  - N : total number of urban blocks in frame/total number of villages (Arunachal Pradesh)-(used for selection)
  - n : number of sample villages/blocks available for tabulation
  - D : number of hamlet-groups/sub-blocks formed
  - c : number of census villages in surveyed revenue village
  - H : total number of households listed in a sample village/block
  - h : number of sample households available for tabulation
  - y : value of any character of sample village/block/household

In case of Y, X and R, a cap (^) placed over the symbol (e.g.  $\hat{Y}$ ) denotes the estimate obtained from the sample.

A. Estimates of aggregates-rural sector The formulae for stratum level estimates of aggregates of  $y$  for the rural sector are given below

A.1. Schedules 12.1 and 12 (all states/U.T.'s except Arunachal Pradesh)

$$Y_s = \frac{P_s}{n_s} \sum_{i=1}^{n_s} \frac{D_{si}}{c_{si} \cdot P_{si}} \frac{h_{si}}{h_{si}} y_{si}$$

A.4. Schedules 12.1 and 12 (Arunachal Pradesh)

$$\hat{Y}_s = N_s \sum_{i=1}^{n_s} \frac{D_{si}}{c_{si}} \cdot \frac{h_{si}}{h_{si}} y_{si}$$

A.5. The estimates of aggregates at region or at state/U.T. level is obtained by summing over the estimates of the constituent strata.

Thus, 
$$\hat{Y}_r = \sum_s \hat{Y}_s \quad \text{or} \quad Y_r = \sum_s Y_s$$

where the summation is over all  $s$  : the region or state/U.T.

Estimates of aggregates-urban sector : The formulas for stratum level estimates of aggregate  $y$  for the urban sector are as follows:

Schedule 12.1 and 12 (all states/U.T.'s)

$$\hat{Y}_s = \frac{N_s}{n_s} \sum_{i=1}^{n_s} \frac{D_{si}}{h_{si}} \frac{h_{si}}{h_{si}} y_{si}$$

A.8. As in the rural sector, the estimates of aggregates at region and state/U.T. levels are obtained by summing over the estimates of the constituent strata.
