FERTILITY RATES IN INDIA

Section One

E X T R A Q U E S T I O N

1.1 Under the normal cycle of its work programme, the National Sample Survey Organisation (NSSO) conducted once again an enquiry on population, births and deaths in the NSS 39th round (January - June 1984). The previous enquiry of this type was carried out about ten years earlier. The NSS this time preferred the survey to be conducted by the enumeration and re-enumeration method which would ensure netting most of the events of births and deaths. In addition, the method of direct enquiry for collecting information on births and deaths had also been adopted to derive an independent estimate of the vital rates. Consequently, two schedules were canvassed - Schedule 12 for enumeration of births and deaths occurring during the preceding two years; and Schedule 12.1 for reenumeration of population, enumeration of births and deaths occurring to household members enlisted in the previous survey, NSS 38th round conducted about a year earlier, and to elicit certain information on fertility.

1.2 Schedule 12.1 - Population, births and deaths enumeration & re-enumeration : The population survey in the 39th round was carried out in a sub-sample of the villages and blocks surveyed in the first and second sub-rounds (January-June 1983) of the 38th round. The schedule of enquiry, schedule 12.1, was split into two parts. The basic list of households and persons for schedule 12.1 was comprised of those households from whom the employment/unemployment schedule had earlier been canvassed during the first and second sub-rounds of the 38th round. The information collected with respect to members of these households (who were also in the 38th round sample) formed the re-enumeration part (Part-I) of schedule 12.1 of the 39th round. In Part-II of schedule 12.1, all events of births and deaths were recorded which occurred during the intervening period between the date of enumeration (1983) and the date of re-enumeration (1984), to household members listed at the time of first enumeration, January to June 1983.

'Part-II, all the events of births and deaths occurring to household members enlisted ~~at~~ the time of first enumeration (January - June 1983), during the intervening period between the date of enumeration (1983) and the date of re-enumeration (1984), were recorded. Information on total fertility was also collected from the ever married female members of the sample households, at the time of re-enumeration. In general, all the ten households surveyed in a sample village/block in the first half of 1983 were revisited in 1984 for canvassing the schedule 12.1

- 1.3 ~~In the~~ ^{an} earlier report, the information on some important features of the population alongwith the birth rates, death rates and age-specific fertility and mortality rates, derived from the data collected in the NSS 39th round, have been presented.
- 1.4 In this report, the information on total fertility of the women collected through schedule 12.1 of the NSS 39th round, have been presented. It includes the distribution of ever married women over the number of children ever born to them, the completed fertility of the ever-married women aged (45-49) years by educational standard of women and religion, and total fertility of the ever married women by their marriage duration.
- 1.5 Approach of this report The scope coverage and sample design of the 39th round survey are given in Section Two of this report. Concepts and definitions of some demographic parameters are presented in Section Three. In Section Four, summary of the main findings ~~are described~~ ^{to be described}. The detailed tables follow in Appendix-I of this report. The estimation procedure has been ~~described~~ ^{and in this report} ~~described~~ in Appendix-II. The report ends with a comparison of the findings from the NSS 39th round survey data and the fertility indices derived from the 1981 census enumeration ^{Appendix} ~~data~~ in Appendix-III.

1/ Draft Report No. 351 : Population and Birth and Death Rates, NSS 39th round, April, 1988.

Section Two

SCOPE, COVERAGE AND SAMPLE DESIGN

- 2.1 Geographical coverage The survey covered the whole of the Indian Union excepting (i) Ladakh and Kargil districts of Jammu & Kashmir and (ii) rural areas of Nagaland.
- 2.2 Sample design : This survey on population, births and deaths, as stated earlier was carried out in the 39th round in ~~suo~~ ^{Surveyed in} sample of surveyed sample villages and blocks ~~of~~ the first and second sub-rounds of the 38th round. Hence the sample design for the 39th round was the same as that of 38th round.
- 2.3 The basic design for the survey was a two stage stratified design. The first stage units (f.s.u.'s) were census villages in the rural sector and urban blocks (urban frame survey) in the urban sector. The second stage units were households in both the sectors.
- 2.4 Selection of f.s.u.' The sample villages were selected with probability proportional to size (population) with replacement, in the form of two independent interpenetrating sub-samples (IPNS) in the 38th round of NSS for employment and unemployment survey. Sample blocks were selected with equal probability, also in the form of two IPNS's. A sub-sample of sample villages/blocks of the first and second sub-rounds of 38th round formed the first stage units of NSS 39th round.
- 2.5 Selection of second stage unit (households) A sample of 10 households ~~were~~ selected circular systematically from each sample village/block of first and second sub-rounds of ~~the~~ 38th round for the employment and un-employment survey, after arranging all the households in a specified manner. In case the total number of households in a sample village/block ~~were~~ 10 or less, all the households were included in the sample. The same set of sample households surveyed for employment and unemployment survey in the 38th round were surveyed for schedule 12.1 in the 39th round.

2. The rural/urban allocations of first stage units in a state/U.T. considering the relative sizes of rural and urban population were further allocated to the constituent rural/urban strata in proportion to the rural/urban population. The strata level allocations were rounded off to multiples of two. A final adjustment was made to ensure that the samples allocated to each FOD Region matched with its net investigator strength. The final strata-wise allocations thus determined ~~and~~ added up gave U.T./state/all-India sample size for the central sample. The number of sample villages and urban blocks allotted and surveyed alongwith the households surveyed in schedule 12.1 in the central sample for NSS 39th round is given in table 2.1.

Section Three

CONCEPTS AND DEFINITIONS

3.1 Age at effective marriage of a woman : This refers to the age at which the woman began to live with her husband. The effective marriage of husband and wife is reckoned to start when they begin to live together . In case a woman, married more than once , the age at her first effective marriage is taken into account.

3.2 Marriage duration : This refers to the duration of marriage reckoned from the day of first effective marriage. This is determined from the age on the day of enquiry (present age) and the age at effective marriage in the case of couples alive on the day of enquiry, and from the age of termination of marriage due to death of husband, divorce or separation and the age at effective marriage.

3.3 Age-specific fertility rate : It is estimated by relating the total number of live births occurring to the women of specified age-group to the total number of women in that age-group.

3.4 Total fertility rate : This is the sum through all ages of the age-specific fertility rates.

3.5 Gross reproduction rate : The gross reproduction rate is obtained by adding through the ages of the age-specific fertility rate if only female births are counted for estimating age-specific fertility rate.

Section Four

SUMMARY OF FINDINGS

4.1 The survey results show that the composition of population for rural and urban sectors of all-India is in the ratio of about 78 : 22. The overall sex ratio (females per 1000 males) is 960 in the rural sector and 914 in the urban sector of all-India. In the age-group (15-49) years, the share of female population is 47.64 percent in the rural sector against 51.18 percent in the urban sector to the total females in the respective sectors. The corresponding shares of male population are 45.95 and 52.41 percent respectively in the rural and urban sectors of all-India. Among the females, 54.5 percent are ever-married and 45.6 percent are currently married in the rural sector. The corresponding percentages of ever-married females and currently married females are 51.3 and 42.3 percent respectively in the urban sector.

4.2 Fertility of currently married (effectively married) women : The average number of children ever born to currently married women is given for different age-groups of women in table (4.1). The average number of children everborn

TABLE(4.1) : AVERAGE NUMBER OF CHILDREN EVER BORN TO CURRENTLY MARRIED (EFFECTIVELY MARRIED) WOMEN BY AGE OF WOMEN FOR RURAL AND URBAN SECTORS OF ALL-INDIA

sector	age (years) of currently married women							
	15-19	20-24	25-29	30-34	35-39	40-44	45-49	15-49
(1)	(2)	(3)	(4)	(5)	(6)	(7)	(8)	(9)
rural	0.54	1.44	2.68	3.77	4.46	4.89	5.24	3.20
urban	0.70	1.43	2.53	3.32	4.04	4.51	5.01	3.14

to currently married women aged (15-49) years is marginally higher in the rural sector (3.20) than that in the urban sector (3.14). A similar feature of higher number of children ever born to currently married women is observed in the rural sector for all the age groups except (15-19) year. The marginally higher average number of children ever born in the age group of (15-19) years in the urban sector may be attributed to some other reason than the natural phenomenon.

4.3 Fertility of women aged (15-49) years : In table (4.2), average number of children ever born to women aged (15-49) years is given for different age-groups of women for rural and urban sectors of all-India. It reveals a steady increase in the average number of children from the lower age-groups of the women to the higher age-groups within the fertility period of (15-49) years for both rural and urban sectors of all-India. A higher average number of

TABLE (4.2) : AVERAGE NUMBER OF CHILDREN EVER BORN TO WOMEN AGED (15-49) YEARS BY AGE OF WOMEN FOR RURAL AND URBAN SECTORS OF ALL-INDIA

sector (1)	age (years) of women							
	15-19 (2)	20-24 (3)	25-29 (4)	30-34 (5)	35-39 (6)	40-44 (7)	45-49 (8)	15-49 (9)
rural	0.17	1.14	2.46	3.48	4.16	4.43	4.68	2.49
urban	0.13	0.90	2.16	3.05	3.70	4.16	4.53	2.21

children ever born to women is observed for all age-groups in the rural sector compared to that in the urban. An average of 2.49 children ever born is observed in the rural sector which is slightly higher than the corresponding average of 2.21 children in the urban sector.

4.4 Fertility of ever-married women and marriage duration :

It is observed from table (4.3) that the number of children ever born to ever-married women increases, as expected, with the duration of marriage increasing. In the urban sector, the average number of children ever born to ever married women is observed to be higher for the shorter marriage duration periods of (0-4) and (5-9) years as compared to the rural sector. For the marriage duration of 20 yrs. & above, the average number of children ever born are 4.89 and 4.68 in the rural and urban sectors respectively.

TABLE (4.3) : AVERAGE NUMBER OF CHILDREN EVER BORN TO EVER-MARRIED WOMEN AGED (15-49) YEARS BY MARRIAGE DURATION FOR RURAL AND URBAN SECTORS OF ALL-INDIA

sector	marriage duration (years)				
	0 - 4	5 - 9	10 - 14	15 - 19	20 & above
(1)	(2)	(3)	(4)	(5)	(6)
rural	0.51	1.84	3.13	3.96	4.89
urban	0.59	1.90	3.03	3.70	4.68

4.5 Completed fertility of ever-married women (45-49) years and age at first effective marriage : The fertility of ever-married women of (45-49) years are given in table (4.4).

TABLE (4.4) : AVERAGE NUMBER OF CHILDREN EVER BORN TO EVER-MARRIED WOMEN AGED (45-49) YEARS BY AGE AT FIRST EFFECTIVE MARRIAGE FOR RURAL AND URBAN SECTORS OF ALL-INDIA

sector	age at first effective marriage (years)				
	below 15	15-19	20-24	25 & above	all ages
(1)	(2)	(3)	(4)	(5)	(6)
rural	4.66	5.06	5.22	3.68	4.71
urban	4.85	4.52	4.28	3.68	4.61

It is observed in the urban sector that the average number of children ever born decreases with the increase in the age at first effective marriage of women. In the rural sector, for the first three groups of age at effective marriage, the fertility behaviour of women exhibit an opposite trend : the number of children ever born increasing with advancing age at effective marriage and reaching a maximum of 5.22 children in the age at effective marriage group of 20-24 years. However, it sharply falls to 3.68 children per ever married women with age at effective marriage of 25 years or more. In earlier studies it has been noted that the total fertility is not much related with age at marriage. The total number of children born to women belonging to different age at marriage groups remains almost at the same level and perceptible fall in total fertility is observed when the age at marriage is 25 years or more^{a/}. In another study it was observed that the total fertility decreased with advancing age at marriage from the lowest age group of 15 to 19 years ^{b/}. The overall fertility of ever-married women is observed to be slightly lower in the urban sector than in the rural sector.

4.6 Completed fertility of ever-married women (45-49) years and educational standard of women : The fertility of ever-married women of (45-49) years, observed in table(4.5), has decreased with the increase in the educational standard of the women. In the rural areas, there is hardly any relationship between the number of children ever born to ever-married women and their level of education. Total fertility is, however, much lower for women having secondary and higher level of

a/ N.C. Das, "A note on the effect of postponement of marriage on fertility" Poceedings of the World Population Conference, 1965, Vol. II, pp. 128-129.

b/ S.N. Agarwala, "Effect of a rise in female marriage age on birth rate in India". Proceedings of the World Population Conference, 1965, Vol.II, pp. 172.

11

TABLE (4.5) : AVERAGE NUMBER OF CHILDREN EVER BORN TO EVER-MARRIED WOMEN (45-49) YEARS BY EDUCATIONAL STANDARD OF WOMEN FOR RURAL AND URBAN SECTORS OF ALL-INDIA

sector	educational standard of women					all standards
	not literate	literate but below primary	primary and middle	secondary and above	(6)	
(1)	(2)	(3)	(4)	(5)		
rural	4.71	4.67	4.87	3.26	4.71	
urban	5.12	4.20	4.03	3.32	4.61	

education. Thus, there is no impact of literacy and educational level (below secondary) on the total number of children born. The difference in the relationship between level of education of women and the total number of children born to them at the end of their reproductive life for the rural and urban areas might be due mainly to difference in the extent of attitude and effective action to control fertility in the two sectors. Whereas in the rural areas, the fertility is ~~still~~ generally uncontrolled due to lack of knowledge of family planning methods or non-availability of advice and appliances, literate women in urban areas have better access to such facilities and gather better knowledge through the communication media and are in a position to effectively control the size of their families. The average number of children ever born to the ever-married women is higher when the educational standard of the women are 'not literate' and 'secondary and above' in the urban sector than in the rural sector.

4.7 Completed fertility of ever-married women (45-49) years and religion : The average number of children ever born to ever-married women by religion is given in statement (4.6). It is observed that the average number of children ever born is highest for Muslim-women for rural (5.33) and urban (5.98) sectors of all-India. It is followed by Sikh-women(5.03) in the rural sector and by Buddhist-women (5.14) in the urban sector.

STATEMENT (4.6) : AVERAGE NUMBER OF CHILDREN EVER BORN TO EVER-MARRIED WOMEN BY RELIGION FOR RURAL AND URBAN SECTORS OF ALL-INDIA

sector	religion								all reli- gions
	Hindu- ism	Islam	Chris- tianity	Sikhism	Buddh- ism	Jainism	others		
(1)	(2)	(3)	(4)	(5)	(6)	(7)	(8)	(9)	
rural	4.64	5.33	4.30	5.03	4.46	4.56	4.85	4.71	
urban	4.58	5.98	3.73	2.86	5.14	4.25	4.16	4.61	

The average number of children ever born is the lowest among the Sikh-women (2.86) followed by Christian women (3.73) in the urban sector.

4.8 Proportion of children born alive & alive now and marriage duration : It is observed from statement (4.7) that the proportion of children surviving to ever-married women is related to the duration of marriage. The women with longer marriage duration have relatively lower proportion of surviving children for both rural and urban sectors.

STATEMENT (4.7) : PROPORTION OF CHILDREN BORN ALIVE & ALIVE NOW
 (PER 100 000 CHILDREN EVER BORN) TO EVER-MARRIED WOMEN BY MARRIAGE DURATION AND SEX OF CHILDREN FOR RURAL AND URBAN SECTORS OF ALL-INDIA

sector	sex of children ever born	marriage duration (years)				
		0 - 4	5 - 9	10 - 14	15 - 19	20 & above
(1)	(2)	(3)	(4)	(5)	(6)	(7)
rural	male	88201	86811	85964	85360	81964
	female	90325	89157	86696	85251	81555
	total	89133	88974	86317	85319	81772
urban	male	95021	91430	89577	91232	86072
	female	95987	92494	91568	90391	86512
	total	95445	91936	90522	90824	86278

It is also observed that the proportion of female-children surviving is relatively higher compared to the male-children for shorter durations of marriage and the proportions are always higher for urban sector than for rural sector.

4.9 Proportion of children alive and alive now and age of ever-married women : In statement (4.8), it is observed that the proportion of children born alive and alive now to ever-married women rises from the age-group (15-19) to (20-24) and then declines steadily in the following age-groups upto (45-49) years. This trend is observed for the children of either sex in both rural and urban sectors, except for the proportion of male children in the urban sector which declines from the begining of the reproductive age-group of ever-married women. The proportion of children born alive and alive

now to ever-married women, however, is favourable to urban sector compared to that in the rural sector.

STATEMENT (4.8) : PROPORTION OF CHILDREN BORN ALIVE AND ALIVE NOW (PER 100 000 CHILDREN EVER BORN) TO EVER-MARRIED WOMEN BY AGE OF EVER-MARRIED (EFFECTIVELY MARRIED) WOMEN AND SEX OF CHILDREN FOR RURAL AND URBAN SECTORS OF ALL-INDIA.

DATA PROCESSING

.1 Notation : The following notations are used in the sequel :-

- s : subscript for state/union territory
- r : subscript for region
- s : subscript for stratum
- i : subscript for sample village/block
- j : subscript for sample household
- P : total frame population in rural sector (used for selection)
- p : population of sample village (used for selection)
- N : total number of urban blocks in frame/total number of villages (Arunachal Pradesh) - (used for selection)
- n : number of sample villages/blocks available for tabulation
- D : number of hamlet-groups/sub-blocks formed
- c : number of census villages in surveyed revenue village
- H : total number of households listed in a sample village/block
- h : number of sample households available for tabulation
- y : value of any character of sample village/block/household

In case of Y and X, a cap (^) placed over the symbol (e.g. \hat{Y}) denotes the estimate obtained from the sample.

- I.2 Estimates of aggregates - rural sector : The formulas for stratum level estimates of aggregates of y for the rural sector are given below :

- I.3 Schedule 12.1 (all states/U.T.'s except Arunachal Pradesh)

$$\hat{Y}_s = \frac{P_s}{n_s} \sum_{i=1}^{n_s} \frac{D_{si}}{c_{si}} \frac{H_{si}}{h_{si}} \sum_{j=1}^{h_{si}} y_{sij}$$

- I.4 Schedule 12.1 (Arunachal Pradesh)

$$\hat{Y}_s = \frac{N_s}{n_s} \sum_{i=1}^{n_s} \frac{D_{si}}{c_{si}} \frac{H_{si}}{h_{si}} \sum_{j=1}^{h_{si}} y_{sij}$$

- I.5 The estimates of aggregates at region or at state/U.T. level is obtained by summing over the estimates of the constituent strata.

$$\text{Thus, } \hat{Y}_r = \sum_s \hat{Y}_s, \text{ or } \hat{Y}_s = \sum_s \hat{Y}_s$$

where the summation is over all the strata of the region or state/U.T.

- I.6 Estimates of aggregates - urban sector : The formulas for stratum level estimates of aggregates of y for the urban sector are as follows :

- I.7 Schedule 12.1 (all states/U.T.'s)

$$\hat{Y}_s = \frac{N_s}{n_s} \sum_{i=1}^{n_s} \frac{D_{si}}{\frac{H_{si}}{h_{si}}} \sum_{j=1}^{h_{si}} y_{sij}$$

- I.8 As in the rural sector, the estimates of aggregates at region and state/U.T. levels are given by summing over the estimates of the constituent strata.

- A-65 -
Appendix - III

FERTILITY RATES - OBSERVED IN CENSUS 1981 AND NSS
39TH ROUND

III.1 Sex-ratio, defined as the number of females per 1000 males, is observed to be 933 in the census 1981 as against 960 in the rural and 914 in the urban sector of all-India in the NSS 39th round (January-June 1984).

III.2 Currently married women by age-groups : A currently married person is one whose marriage, whether for the first or any other time, subsists at the time of enumeration, with the spouse living. The proportion of currently married women by age-groups are presented in table (III.1) It is observed that the proportion of currently married women rises sharply between the age-groups (15-19) and (20-24) and reaches the maximum in the age-group (25-29) in the rural sector and age-group (30-34) in urban sector of all-India. This trend in the currently married women is followed ~~in~~ both ^{in the} census 1981 and ^{in the} NSS 39th round. Compared to Census 1981, the proportion of currently married women in all the age-groups are less in the NSS 39th round for both the sectors of all-India. The differences are somewhat larger in the lower age-groups and converges in the higher age-groups, except

TABLE (III.1) : PERCENTAGE OF WOMEN REPORTED TO BE MARRIED IN CENSUS 1981 AND IN NSS 39TH ROUND, BY AGE-GROUPS FOR RURAL AND URBAN SECTORS OF ALL-INDIA

age-group (years)	r u r a l		u r b a n	
	census 1981*	39th round	census 1981*	39th round
	(1)	(2)	(3)	(4)
