NATIONAL SAMPLE SURVEY
FORTYSECOND ROUND : JULY 1986 - JUNE 1987

CHILD AND MATERNITY CARE

NUMBER 368

Section One

I N T R O D U C T I O N

1.0 The National Sample Survey Organisation (NSSO) had conducted a survey on social consumption in the 42nd round during the period from July 1986 to June 1987 in order to assess the benefits derived by various sections of society from public expenditure incurred by the government with a view to providing necessary care for education, health, family planning etc. The first report^{1/} of this survey on the availability of drinking water, electricity and disinfection of dwellings etc. and the second report^{2/} on the utilisation of public distribution system had already been released. The present report provides an idea about the various services relating to child and maternity care availed by different sections of population both in rural and urban sectors of 18 major states and all India.

1.1 Coverage : The geographical coverage of the 42nd round survey was extended over the whole of rural and urban areas of Indian union excepting Ladakh and Kargil districts of Jammu and Kashmir and rural areas of Nagaland.

1.2 Sample size : The survey data collected through schedule 25.1 of 42nd round covered about 73, 564 households spread over 8400 villages and 4465 blocks. The present report provides the results of some selected major states. The results of the states which have not been presented separately in this report are, however, included in the all India estimate.

-
1. NSS Draft Report No. 361 : A profile of households and population by economic class and social group and availability of drinking water, electricity and disinfection of dwellings, NSS 42nd round (July 1986 - June 1987)
 2. NSS Draft Report No. 362 : Utilisation of Public Distribution System, NSS 42nd round (July 1986 - June 1987)

1.3 Participation of states : In the 42nd round survey all the states and union territories (included in the geographical coverage) except Andaman & Nicobar Islands, Chandigarh, Dadra and Nagar Haveli and Lakshadweep participated in the survey on at least equal matching basis. The results presented in this report are, however, based on central samples only.

1.4 Contents of the report : The report contains tables separately for rural and urban sectors in respect of selected states as also for all India. In addition to these tables, the other sections of the report contain i) Concepts and Definitions ii) Sample Design and Estimation Procedure iii) Explanatory Note on Tables and iv) Summary of Findings.

Section Two

CONCEPTS AND DEFINITIONS

2.0 Some of the concepts and definitions followed during 42nd round survey on social consumption are explained below.

2.1 Household : A household is a group of persons normally living together and taking food from a common kitchen. A boarding house or a hotel or a hostel is treated as a cluster of households where each individual boarder (with his dependant or guests) forms a separate household by itself. Households maintained and provided food directly by government, such as those in prisons, police quarters, cantonments, hospitals, asylums, relief camps are, however, excluded from the scope of the survey.

2.2 Household size : The total number of members in a household is considered to be the household size.

2.3 Immunisation : One of the most important public health services is immunisation of children in the form of inoculation or vaccination to procure immunity from developing certain infectious diseases. Accordingly, information were collected as to whether children between 0 and 15 years of age have ever been immunised with polio and triple-antigen which are administered generally as a course of several doses with one or more booster doses. Polio vaccine is given generally as oral liquid and sometimes as injection in 3 of 4 doses at an interval of 1 to 2 months. The first dose is given when the child is 3-9 months old and one or more booster doses are also given after the child attains the age of 18 months. The vaccine of triple-antigen is usually injected in three doses at an interval of 1-2 months for immunising the child from diptheria, whooping cough and tetanus. First injection is usually given when the child is 3-9 months old and a booster dose is also injected when the child is generally of age 18 to 24 months.

2.4 Registration for paediatric care : New born children are often registered in hospitals, primary health centres, family welfare centres, maternity homes or with doctors, auxiliary nurses, lady health visitors etc. for periodic medical check up. Such services are rendered by these institutions and medical/para-medical persons upto a certain period after birth. In some cases, on receipt of information of a child birth, an auxiliary nurse or lady health visitor visits the household for the health care of the new born. These cases are regarded as registered for paediatric care. Information were collected whether the children aged between 0 and 4 years in a household were registered for such paediatric care and also the institutions or personnels with whom they were registered to avail such services.

2.5 Pre-natal and post-natal care : Proper health care under medical advice is necessary for the expectant mothers for safe child-births and healthy babies apart from protecting the mothers from any possible hazards. Such advices which the mothers may like to have at regular intervals before the child-birth are known as pre-natal care. Similarly post-natal care is concerned with the medical advice necessary for the mothers to regain her health after the strains of child-bearing. Usually when an expectant mother goes to the out patient department (O.P.D.) of a hospital for pre-natal care, her name is registered in the hospital and a card/ticket is issued to her on which the attending physician records his advice and the next date of check up. In case of consultation in a doctor's clinic such registration may not be necessary. Nevertheless, the doctor advises her as to when she is to report to him again for next check up. Such cases were also treated as 'registered for pre-natal care'. The cases of a doctor attending the expectant mother at her residence was also treated as registered. However, occasional consultation with a doctor or in a hospital during pregnancy for some sudden complication or ailment was not treated as registered for pre-natal care. In case the mother was not registered in a hospital

or with a doctor but was advised by auxiliary nurse/lady health visitor visiting the household regularly, then also the expectant mother was regarded as registered for pre-natal care. Similar cases of medical consultation and advice in respect of mothers after child-birth were regarded as post-natal care. Informations for such pre-natal and post-natal care of mothers were collected in respect of births corresponding to infants born within a period of last 365 days preceding the day of survey and living on the day of enquiry.

2.6 Domiciliary births and hospital births : When a child was born at home it was considered as a domiciliary birth. 'At home' means a residential place which may be the residence of the mother or of her father or of her any relative or any other house. Similarly, when a child was born in a hospital it was considered as a hospital birth which also includes births in primary health centres, public dispensaries, nursing homes etc. Information were collected as to what extent the births took place at home and at hospital as also the types of medical attendance at the time of birth and the different reasons for non-hospitalisation.

Section Three

SAMPLE DESIGN AND ESTIMATION PROCEDURE

3.0 Sampling design : The sampling design adopted in the 42nd round survey was a two-stage stratified one with census villages in rural areas and Urban Frame Survey (UFS) blocks in the urban areas as the first stage units and households as second stage units. The sample villages were selected with probability proportional to population with replacement in the form of two independent interpenetrating sub-samples while the sample blocks were selected by equal probability without replacement also in the form of two independent interpenetrating sub-samples. After arranging all the households in a specified manner four sample households from each first stage unit were selected following circular systematic sampling.

3.1 Sampling frame : The sampling frame for the rural areas was the list of villages as per 1981 decennial census population except for Assam where 1971 census list of villages had been used. For the urban areas the list of Urban Frame Survey (UFS) blocks had been used as frames.

3.2 Survey period and sub-round formation : The survey started from July 1986 and continued upto 1987. The entire survey period of one year was divided into four sub-rounds each of three months duration as follows :

July 1986 to September 1986 : Sub-round 1
October 1986 to December 1986: Sub-round 2
January 1987 to March 1987 : Sub-round 3
April 1987 to June 1987 : Sub-round 4

The samples were equally distributed over the four sub-rounds in a manner so as to provide equally valid estimates for each of the related sub-round period. The averages based on the pooled data for all the sub-rounds taken together would account for seasonal variations and thus would be free from seasonal effects.

3.3 Estimation Procedure : The estimation procedure adopted in the 42nd round is based on weighted sum of sample values. Denoting by \hat{Y} , the unbiased estimate of Y (the state total of any variate), it is given by

$$\hat{Y} = \sum_s \frac{P_s}{n_s} \sum_i \frac{D_{si}}{p_{si} e_{si}} \frac{H_{si}}{h_{si}} \sum_j Y_{sij} \dots (1) \text{ for rural sector}$$

and

$$\hat{Y} = \sum_s \frac{N_s}{n_s} \sum_i D_{si} \frac{H_{si}}{h_{si}} \sum_j Y_{sij} \dots (2) \text{ for urban sector}$$

where s , i and j stand for stratum, village/block and household respectively;

P_s , N_s and n_s denote the population, number of villages/blocks in the frame and number of villages/blocks in the s th stratum respectively; D_{si} , e_{si} and p_{si} denote the number of hamlet groups/sub-blocks formed, number of census villages contained in a large revenue village and the population for the i th sample village in the s th stratum respectively;

H_{si} and h_{si} stand for total number of households listed and number of sample households for the i th village/block in the s th stratum respectively and finally Y_{sij} is the observed value of the variate for the j th sample household in the i th village/block belonging to the s th stratum. Estimate of ratio of two characteristics is given by the ratio of the estimates of their aggregates.

Section Four

EXPLANATORY NOTES ON TABLES

4.0 The tables presented in this report give i) percentage of children taken vaccine of polio and triple-antigen by age-group fractile group and adult female education class ii) percentage of children taken booster dose of polio and triple-antigen by fractile group iii) percentage of children (0-4 years) registered for paediatric care by type of medical institution/personnel registered with and fractile group/adult female education class iv) percentage of children aged 0-4 years receiving supplementary food during last 365 days and their percentage distribution over fractile groups by type of feeding centres v) percentage distribution of mothers registered for pre-natal and post-natal care over fractile groups by type of medical institution/personnel registered with vi) percentage of domiciliary births and their percentage distribution over attendance types by fractile group/adult female education class and vii) percentage of hospital births, their percentage distribution by type of hospital and percentage distribution of non-hospitalised births by reason for non-hospitalisation for child-birth over fractile group separately for rural and urban sectors respectively.

4.1 Fractile group : All the households belonging to a state had been arranged in the ascending order of household monthly per capita consumer expenditure and then the estimated number of households corresponding to each sample household had been cumulated to arrive at the total of estimated number of households (M). Since the basic fractile classification is at 10 percent level, there will be 10 exclusive fractile groups each accounting for approximately 10 percent households (i.e. $M/10$ households). The fractile groups presented in this report are generally the percentile groups of 0-1, 10-20, 20-30, 30-40, 40-50, 50-60, 60-70, 70-80, 80-90 and 90-100.

4.2 Adult female education class : Adult female education class relates to the highest education level among all adult female members of the household. The classes are illiterate, literate but below primary, primary but below secondary and secondary and above.

Section FiveSUMMARY OF FINDINGS

5.0 It has already been stated in section two of this report that an important facility being made available to the children under public health measures is vaccination/inoculation to procure immunity from certain fatal diseases. Table S1 and S2 give the percentage of children taken vaccine of polio and triple-antigen respectively by age-group and sector for states and all-India. It is seen that about 20 percent of children living in rural India were taken vaccine of polio against a corresponding percentage of about 46 in the urban sector. Similarly, only about 16 percent of rural children were administered vaccine of triple-antigen while 38 percent of children living in urban India were taken this vaccine. This indicates that the children living in urban sector have got more access to vaccination than their rural counterparts and this pattern is also observed, in general, in respect of all the states. It is further evident from the results that while the rural areas of Goa (79.43), Pondicherry (72.13) and Delhi (70.27) exhibited a significantly higher percentage of children immunised against polio and also the states of Maharashtra (55.10), Gujarat (50.70), Himachal Pradesh (49.18), Kerala (47.26), Tamil Nadu (44.25) and Punjab (43.84) recorded the corresponding percentage varying between 44 and 55, in the remaining states especially those in the eastern sector as also Uttar Pradesh, Madhya Pradesh and Rajasthan the extent of immunisation of rural children against polio is considerably low varying between 4 percent and 13 percent. These states are also found to report less percentage of children immunised in their corresponding urban sector than those reported at all India level (46.32).

5.1 It is seen from Table S2 that the states reporting higher percentage of children immunised against polio and also those reporting less are found to maintain more or less similar trend in respect of immunisation with triple-antigen. Moreover, it is also observed in general that for each age-group the percentage

a/d

of children immunised against polio is more than those who were administered the vaccine of triple-antigen both in rural and urban sectors in respect of almost all the states and all-India. In the rural sector the extent of vaccination of triple-antigen among children was reported to be lowest for Bihar (1.70) followed by Rajasthan (1.97), Uttar Pradesh (2.27), Tripura (2.59), Orissa (4.50), Meghalaya (4.76), Madhya Pradesh (4.82), Assam (6.11) and West Bengal (10.18) while the rural areas of Goa (73.76), Pondicherry (67.57) and Delhi (63.53) as also Maharashtra (48.43), Gujarat (47.93) and Kerala (43.06) continued to occupy the top positions as observed in respect of vaccination of polio. It is further evident from the results that for each such vaccination of polio and triple-antigen both in rural and urban sectors in respect of most of the states and all-India, the percentage of children immunised increases with decrease of age-group. This trend is indicative of the fact that with the passage of time more and more children are availing this particular service of health care, or in other words, the children born during recent years preceding the survey period got immunised to a greater extent than those born little earlier. However, the percentage of children vaccinated for polio and triple-antigen are observed to be maximum in the age-group 0-4 years both in rural and urban sectors.

5.2 The booster dose of polio and triple-antigen is necessary to reinforce the effect of these two vaccines so as to increase the degree of immunity against any possible attack with the concerned diseases. It may as well be considered as a follow-up of the primary vaccination in order to supplement the protective force of the vaccines which might wane as the child grows up. Table S3 gives the percentage of children taken booster dose of polio and triple-antigen by sector and states. It is seen from the results that at all-India level while about 11 percent of children were taken booster dose of polio in the rural sector, it is around 27 percent as observed in the urban sector.

Similarly, the percentage of children taken booster dose of triple-antigen are found to be of the order of only 8 and 21 in the rural and urban India respectively. Goa, Delhi, Pondicherry,

TABLE (S3): PERCENTAGE (0.00) OF CHILDREN TAKEN BOOSTER DOSE OF POLIO AND TRIPLE-ANTIGEN BY SECTOR & STATES AND ALL INDIA.

Maharashtra and Gujarat which showed relatively higher percentage of children vaccinated for polio and triple-antigen were also found to exhibit similar pattern in both the sectors in respect of intake of booster dose of these two vaccines. On the other hand, the states reporting lower percentage of children taken vaccine of polio and triple-antigen were also found to report low percentage in respect of booster doses. It is further evident from the results that in both the sectors of all the states and all-India, the percentage of children reporting to have taken booster doses of polio and triple-antigen is substantially less than those reporting to have taken the primary dose of these two vaccines. While 21 percent of children in rural India were vaccinated for polio, only 11 percent reported to have taken its booster dose. Similarly, the corresponding percentage for urban sector was observed to be 46 and 27 respectively. Likewise for triple-antigen, the percentage of children vaccinated in the rural and urban sectors at all-India level was about 16 and 38, while for its booster dose the corresponding percentage was about 8 and 21. This indicates that the primary vaccination of polio and triple-antigen were considered as enough and presumably either due to ignorance or indifference, the necessary follow-up action by administering the booster dose was not taken in respect of most of the children.

5.3 Having observed the percentage of children immunised against polio and triple-antigen as also those taken booster doses in rural and urban sectors of the states and all-India it is of interest to know as to what extent the children belonging to different sections of the population were benefited by this particular health service. Table S4 provides the percentage of children taken vaccine of polio and triple-antigen and their booster doses by fractile groups and sectors for all-India. It is seen from the results that the percentage of children having taken the vaccine of polio and triple-antigen as also their booster doses increases as one moves up along the fractile classes and this increase is observed to be more rapid in urban

a/d

sector than in rural sector. While the percentage of children belonging to bottom ten percent of the households in rural sector and taken vaccine of polio and triple-antigen was about 15 and 10 respectively, the corresponding percentage in urban sector was observed to be 32 and 22 which is more than double of what was reported in the rural sector. Similarly, for the top ten percent of the households the corresponding percentage in the rural sector was about 41 and 33 as against 80 and 75 in the urban sector. So far as booster doses are concerned similar pattern is also observed. This suggests that the children belonging to richer households are better cared eventhough the extent of such care is relatively on a broader scale in urban areas than in rural.

5.4 In addition to the immunisation of children against any possible attack with some fatal diseases, one of the other services relating to child care is to serve food from food distribution centres to children as supplementary to the food they get at home with a view to raising their nutritional standard and thus improving their health. Such centres distribute nutritive food like milk, bread etc. to vulnerable sections of the children. Information were collected as to whether any time during the last 365 days preceding the day of survey, any such food has been received by the children of age between 0 and 4 years and also the different types of feeding centre serving such food. Table S5 gives the percentage of children (0-4 years) received supplementary food during last 365 days preceding the date of survey by types of feeding centres and sectors for states and all-India. It is seen from the results that only about 4 percent of children in rural India and 2 percent in urban India received supplementary food during the last 365 days preceding the day of enquiry. Similar low percentage was observed in respect of most of the states except Pondicherry (30.93, 5.52), Tamil Nadu (25.77, 7.50), Delhi (9.35, 5.18) and Kerala (8.21, 5.88). Moreover, this particular service of providing supplementary food to the children is found to be more in rural than in urban. It is further seen that whatever supplementary food the children received during last 365 days, most of them were served from the feeding centres controlled by the government while this service from other centres run by other agencies is virtually non-existent.

a/d

5.5 Some medical advices are necessary for the new born babies upto a certain period after birth so that all possible measures could be taken by their parents for their normal growth and these services are categorised under paediatric care as explained in section two of this report. Table S6(R) and S6(U) give the percentage of children (0-4 years) registered for paediatric care and their percentage distribution over different types of medical institutions/personnells for rural and urban sectors respectively. It is seen that at all-India level while in the rural sector about 12 percent of children were registered for paediatric care, the corresponding percentage in the urban sector was about 29. This percentage is observed to be low in respect of rural areas of all the states except Pondicherry (54.52), Goa (46.74), Tamil Nadu (38.76) and Kerala (32.19). In the rural areas of Bihar (2.75), Uttar Pradesh(3.21), Meghalaya(4.09), Rajasthan(4.41), Orissa(5.67), Madhya Pradesh (6.84), Haryana (8.02), Tripura (10.28) and West Bengal (10.83) the percentage is extremely low varying between 3 and 11 percent. So far as urban sector is concerned, more than half of the children were reported to have been registered for paediatric care in Pondicherry (57.56), Tripura (54.21) and Tamil Nadu (53.90) while more than one-third but less than half of the children were registered in Karnataka (45.20), Himachal Pradesh (44.94), Maharashtra (42.94), Goa (39.40), Andhra Pradesh (35.85), West Bengal (35.40), Assam (34.33) and Kerala (32.64). The urban areas of Bihar, Haryana, Madhya Pradesh, Punjab, Rajasthan and Uttar Pradesh exhibited similar pattern of low percentage like their corresponding rural sectors. But in general, it is observed that the extent of the children registered for paediatric care is always more in urban than in rural. It is further evident from the results that at rural India among such children about 30 percent were registered in public hospital followed by registration with the lady health visitor

Note : Difference between the total of columns (3) to (10) and (11) is due to the percentage of children with type of institution not recorded.

Sd

which is about 26 percent while the percentage of registration with primary health centres and private doctors was observed to be around 8 and 7 respectively. In the rural sector of the states it is seen that more than half of the children were registered with public hospital in respect of Pondicherry (66.30), Delhi (65.15), Jammu & Kashmir (62.07) and Goa (50.27), while percentage of registration with the lady health visitor is quite significant in rural areas of Madhya Pradesh (44.07), Karnataka (43.59), Goa (40.46), Himachal Pradesh (37.68) and Gujarat (36.23). There is considerable difference observed in the urban sector with regard to the percentage distribution of children registered for paediatric care over different types of institutions/personnels. As against 30.32 percent of children registered in public hospital observed in rural India, corresponding percentage in urban India was 47.99. Moreover, the extent of registration with the lady health visitor is found to be very low (5.38 percent) in comparison to the corresponding percentage in the rural sector (26.08) and the same low percentage is also observed in respect of the urban sector for all the states. In general, it is seen that of all the institutions with which the children were registered for paediatric care, the public hospital has been found to be quite dominant even though in a little reduced extent in rural than in urban.

5.6 The concept of pre-natal and post-natal care to the mothers had already been explained in section two of this report. Table S7(R) and S7(U) give the percentage of mothers registered for pre-natal care and their percentage distribution over different types of medical institutions/personnels for rural and urban sectors respectively. It is seen from the results that while 21 percent of mothers were registered for pre-natal care in the rural sector at all India level, the corresponding percentage in the urban India was about 47. Among the rural sector of the states quite a high percentage is observed in respect of Pondicherry (100.00), Kerala (72.68) and Tamil Nadu (68.50) while Meghalaya (4.96), Rajasthan (5.98), Bihar (6.31), Uttar Pradesh (6.70), Orissa (7.93) and Madhya Pradesh (7.98) reported very low percentage of mothers registered for pre-natal care.

Sd

As compared to the rural sector, the urban sector exhibited a greater percentage of mothers at all India level as also for most of the states. While more than half of the mothers were reported to have been registered in the urban sectors of Pondicherry (100.00), Tamil Nadu (79.92), Meghalaya (70.79), Himachal Pradesh (68.31), Kerala (65.24), Karnataka (4.43), Maharashtra (63.06), West Bengal (60.47), Assam (60.44), Gujarat (56.01), Andhra Pradesh (55.76) and Delhi (51.22), the states of Bihar, Orissa, Rajasthan and Uttar Pradesh continued to maintain a very low percentage being less than 20. Among the different types of institutions with which the expectant mothers were registered for pre-natal care it is found that in rural India about 25 percent of mothers were registered each with public hospital and lady health visitor followed by private hospital (20.71), primary health centre (11.01) and private doctors (10.75). Compared to this, in urban India 50 percent of mothers were registered with public hospital and about 23 percent in private hospital while 8 percent were registered each with private doctors and nursing homes. There is wide variation observed among different states with regard to the extent of registration in various institutions. While Delhi, Tripura, Jammu & Kashmir, Orissa and Pondicherry reported more than half of the mothers registered with public hospital in their corresponding rural sectors, the extent of registration in private hospitals was found to be relatively high in the rural sector of the southern states of Kerala (44.15), Andhra Pradesh (34.02) and Tamil Nadu (25.52). It is further evident from results of the urban sector that public hospital was favoured by quite a large number of mothers for receiving pre-natal care in the states of Rajasthan (89.78), Madhya Pradesh (78.96), Orissa (76.06), Meghalaya (73.41) and Jammu & Kashmir (71.82), but in the urban areas of Maharashtra, Kerala, Andhra Pradesh and Tamil Nadu the private hospital was found to be quite dominant as in their corresponding rural sectors. In general, it is seen that the expectant mothers living in urban areas are better cared in their pre-natal stages than their rural counterparts and while the services of lady health visitors are mostly pronounced in rural, those of public hospital are widely used in the urban sector.

5.7 As pre-natal care is necessary for the expectant mothers for safe child-births and healthy babies, post-natal care is also equally important for the mothers to regain her health after the strains of child bearing. Tables 8(R) and 8(U) give the percentage of mothers registered for post-natal care and their percentage distribution over different types of medical institutions/personnels for rural and urban sectors respectively. It is seen that only about 13 percent of mothers were registered for post-natal care in rural India as against 24 percent in urban India. Among the rural sectors of the states except Pondicherry (42.37), Goa (41.17), Tamil Nadu (41.01) and Kerala (38.07) the percentage of mothers is observed to be quite low in respect of all other states. Though the extent of registration for post-natal care in urban sector is relatively better than what is observed in rural sector, still it is on a lower side in most of the states except Pondicherry (73.53), Tamil Nadu (49.05), Tripura (47.91), Himachal Pradesh (45.32), Assam (41.65), Kerala (34.59) and Maharashtra (33.50). The percentage distribution of such mothers registered for post-natal care over different types of medical institutions/personnels is observed to follow a similar pattern as in case of their pre-natal care both in rural and urban sectors. Moreover, the mothers registered for post-natal care is found to be less than those registered for pre-natal care in both the sectors of all the states and all-India indicating that in most cases the necessary medical advice is not availed by the mothers after their child birth.

5.8 In order to help the expectant mothers to meet their nutritional requirements, supplementary food and medicines are served to them free of cost from different centres. Such food and medicines are also served to the mothers after their child-birth during their post-natal care. Table S9 gives the percentage of mothers receiving free food and free medicine during pre-natal and post-natal care period by sector and states. It is seen from the results that the service of providing free food to the mothers whether during pre-natal or post-natal care period

Sd

in both the sectors of all the states and all-India is practically non-existent. So far as supply of free medicine is concerned only about 10 percent of mothers received this service during pre-natal care at rural India as against the corresponding percentage of about 19 observed in urban India. Among the rural areas of the states, Pondicherry reported 84 percent of mothers who had received free medicine during their pre-natal care period followed by Tamil Nadu (35.47), Kerala (23.74) and Maharashtra (19.66) while corresponding percentage in respect of other states is less than 20. Similarly, the percentage of such mothers in urban areas is reported to be higher in Himachal Pradesh (37.32), Tamil Nadu (37.22), Karnataka (35.63) and Meghalaya (34.45). It is further evident from the results that the percentage of mothers receiving free food or free medicine is generally more in urban than in rural and also to a greater extent during their pre-natal care than post-natal care period.

5.9 It is of interest to learn as to what extent the children are born at home and also to what extent these births are attended by various medical and para-medical personnels. Tables S10(R) and S10(U) give the percentage of domiciliary births and their percentage distribution over attendance type by states and all India for rural and urban sectors respectively. It is seen from the results that quite a high percentage of child-births take place at home. In the rural sector at all-India level such percentage is as high as 81 compared to 47 percent in urban India. Moreover most of the states reported a large percentage of domiciliary births in their rural sectors except Goa, Kerala and Pondicherry where such births vary from about 6 percent to 26 percent. Though extent of domiciliary births is comparatively less in urban sector, still it is found to be very high in both the sectors of Punjab (80.67, 81.07), Rajasthan (88.71, 78.76) and Uttar Pradesh (91.98, 74.08) and significantly low in Kerala (20.02, 7.64). It is further observed that out of these child-births taking place at home in rural India, about one in every three such births took place without any assistance while about 27 percent of the births were attended by non-government nurses/midwives etc. Similarly, in urban India while about 26 percent of the domiciliary births took place without any assistance about 35 percent of such births took place with

Sd

the assistance of other nurses/midwife etc. So in general, it is seen that occurrence of domiciliary births was relatively higher in rural areas and such domiciliary birth occurring both in rural and urban sectors either remained unattended or were attended by private nurses/midwife etc.

5.10 Having studied the extent of child-birth taking place at home and also the different types of attendance at the time of child-birth it is of interest to learn as to what extent the children were born at hospitals and also the various types of hospitals where such births took place. Table S11 provides the percentage of hospital births and their percentage distribution over types of hospitals by states and sector. It is seen from the results that percentage of children in hospitals is significantly more in urban than in rural sector at all India level with respective percentages being 14 and 48. Moreover while higher percentage of hospital births reported in both the sectors of Goa (93.55, 58.00), Kerala (77.58, 78.75) and Pondicherry (73.64, 100.00), a very low percentage was observed in both the sectors of Haryana (2.47, 34.86), Uttar Pradesh (4.23, 22.44), Bihar (4.99, 27.61), Rajasthan (6.78, 13.90), Orissa (7.09, 27.38) and Punjab (11.09, 14.51). It is further evident from the results that most of the births took place in government hospitals in both the sectors of all-India and states except Andhra Pradesh, Maharashtra and Punjab where percentage of children born in government hospitals fell little short of those born in other hospitals.

5.11 Since the extent of domiciliary births and hospital births are found to vary over states as also between sectors it is of interest to know the various reasons for those child-births which occurred in places other than hospitals. Table S12

Note : Difference between the total of columns (2) to (5) & (6) for rural and columns (7) to (10) & (11) for urban are due to the percentage of non-hospital births with reasons not recorded.

Sd

provides the percentage distribution of non-hospital births over reasons for non-hospitalisation by states and sector. It is evident from the results that one of the dominant reasons for non-hospital births is the choice or preference of the households both in rural and urban areas. In the rural sector at all India level while 44 percent of non-hospital births were due to preference, the corresponding percentage observed in the urban sector was about 51. Non-availability of hospitals was cited as one of the other major reasons in respect of 20 percent of such births occurred in rural India as against 4 percent reported in the corresponding urban sector. This particular reason had been reported to a greater extent in the rural sector of all the states than in their corresponding urban areas. Moreover, while the reason as 'too expensive' was reported almost uniformly in both the sectors of the states and all-India, a considerable percentage for other reasons than those specified was observed in rural as well as in urban areas.
