NATIONAL SAMPLE SURVEY ORGANISATION
FORTYSECOND ROUND : JULY 1986 - JUNE 1987
UTILISATION OF FAMILY PLANNING SERVICES

NUMBER 369

Section One

I N T R O D U C T I O N

1.1 The National Sample Survey Organisation (NSSO) conducted an enquiry on social consumption in its 42nd round survey operation ~~conducted~~ during July 1986 to June 1987. An almost similar enquiry was undertaken earlier also in the NSS 35th round (1980 -81). The results of this survey, however, could not be released. The object of these surveys was essentially to make an assessment of benefits derived by various sections of the society from public expenditure incurred by the government for providing them the necessary educational facilities, health & maternity care, family planning incentives, etc. Information on the various aspects of utilisation of maternity & child care facilities, family planning action programmes, public distribution system, etc. was collected through a specially designed survey questionnaire designated as schedule 25.1. On the basis of the results generated from the data collected through this questionnaire, three reports have already been released. The first report ^{1/} was on availability of drinking water, electricity and facilities of disinfection of dwellings etc. The second report ^{2/} was on utilisation of public distribution system and the third one ^{3/} was on child and maternity care. The present report, based on central sample, provides some results on utilisation of the various facilities relating to family planning services availed of by eligible couples.

-
- 1/ NSS Draft Report No. 361 : A profile of households and population by economic class and social group and availability of drinking water, electricity and disinfection of dwellings, NSS 42nd round (July 1986 - June 1987).
 - 2/ NSS Draft Report No. 362 : Utilisation of public distribution system, NSS 42nd round (July 1986 - June 1987)
 - 3/ NSS Draft Report No. 368 : Child and maternity care, NSS 42nd round (July 1986 - June 1987).

Narayan/

1.2 Collection of information on the utilisation of family planning action programmes was initiated through in the 16th round of the National Sample Survey (NSS). The enquiry was repeated in the 22nd, 23rd and 28th rounds prior to 35th round.

1.3 The information on practice of family planning was collected by interviewing the male partner of the eligible couples. In case of non-availability of male partner, attempt was made to collect the data from the female partner. While studying the results on utilisation of family planning services one should keep in mind the limitation of the data on 'family planning' about which many informants are sensitive and do not like to confide fully to others.

1.4 Content of the report : This report in Section Two gives briefly the scope, coverage and sample design of the survey. Concepts and definitions adopted for the survey are presented in Section Three. Some important summary results for all-India and in certain cases for the different states and union territories also are given in Section Four. Detailed tables are appended and explanatory notes on those tables are given in Section Five. It may be noted that the detailed tables on percentage of couples ever sterilised, sterilised during last 365 days preceeding the date of survey, and received family planning services are given in the appendix for each state/union territory and all-India. All other detailed tables presented in the appendix relate to all-India only. However, some key results for each state and union territory have been presented in the section giving the summary results.

Narayan/

Section Two

SCOPE, COVERAGE AND SAMPLE DESIGN

2.1 Geographical coverage of the survey : The geographical coverage of the NSS 42nd round survey was extended over the whole of rural and urban areas of Indian union excepting Ladakh and Kargil districts of Jammu & Kashmir and rural areas of Nagaland.

2.2 Sample design : The sample design adopted in the survey was a twostage stratified one. The first stage units (f.s.u) were villages in the rural sector and the NSS frame survey urban blocks in the urban sector. The second stage units were households in both the sectors.

2.3 Stratification : In the rural area of each state and union territory, each district with 1981 census rural population less than 1.8 million formed a single stratum. Districts having rural population exceeding 1.8 million were divided into a number of basic strata by grouping contiguous tehasils such that no basic stratum had more than 1.8 million population. In the urban area, the strata were formed according to the population size (1981 census population) of each city/town in a state/union territory.

2.4 Selection of first stage units : The sample villages were selected with probability proportional to population with replacement in the form of two independent interpenetrating subsamples (IPNS). The sample blocks were selected by simple random sampling without replacement (SRSWOR) also in the form of two IPNS.

2.5 Selection of second stage units (households) : A sample of 4 households as second stage units was selected following the procedure of circular systematic sampling from each first stage units in both rural and urban sectors.

Narayan/

2.6 Allocation of first stage units : Considering the field strength available for survey in the various regions, a total sample of 8546 villages and 4656 blocks was selected for the survey. This was allocated to each state and union territory (U.T) in proportion to the net investigator strength of Field Operations Division (FOD), NSSO in the state/U.T. The state/U.T. sample was further allocated to the rural and urban sectors within each state/U.T. in proportion to its rural and urban population. The state level rural/urban sample size was then allocated to the rural/urban strata in proportion to population (rural and urban as in the case may be). The number of sample villages and urban blocks allotted and the households surveyed for the schedule 25.1 by the NSSO (called central sample) is given in statement 2.1. A parallel sample, called state sample, was also allotted to each state and U.T. for survey by the state statistical agency.

2.7 Estimation Procedure : The estimation procedure adopted in the 42nd round is based on weighted sum of sample values. Denoting by \hat{Y} , the unbiased estimate of Y (the state total of any variate), it is given by

$$\hat{Y} = \sum_s \frac{P_s}{n_s} \cdot \sum_{i \in s} \frac{D_{si}}{P_{si} \cdot e_{si}} \cdot \frac{H_{si}}{h_{si}} \cdot \sum_j Y_{sij} \dots (1) \text{ for rural sector}$$

and

$$\hat{Y} = \sum_s \frac{N_s}{n_s} \cdot \sum_i D_{si} \cdot \frac{H_{si}}{h_{si}} \cdot \sum_j Y_{sij} \dots (2) \text{ for urban sector}$$

Where s, i and j stand for stratum, village/block and household respectively;

P_s , N_s and n_s denote the population, number of villages/blocks in the frame and number of villages/blocks in the sth stratum respectively; D_{si} , e_{si} and P_{si} denote the number of hamlet groups/sub-blocks formed, number of census villages contained in a large revenue village and the population for the ith sample village in the sth stratum respectively;

H_{si} and h_{si} stand for total number of households listed and number of sample households for the ith village/block in the sth stratum respectively and finally Y_{sij} is the observed value of the variate for the jth sample household in the ith village/block belonging to the sth stratum. Estimate of ratio of two characteristics is given by the ratio of the estimates of their aggregates.

Section Three

CONCEPTS AND DEFINITIONS

3.1 Some of the concepts and definitions followed during 42nd round survey on social consumption are explained below.

3.2 Household : A household is a group of persons normally living together and taking food from a common kitchen. A boarding house or a hotel or a hostel is treated as a cluster of households where each individual boarder (with his dependant o guests) forms a separate household by itself. Households maintained and provided food directly by government, such as those in prisons, police quarters, cantonments, hospitals, asylums, relief camps are, however, excluded from the scope of the survey.

3.3 Household size : The total number of members in a household is considered to be the household size.

3.4 Eligible couple : An eligible couple, for the purpose of survey, is a married couple, the female partner of which is currently and effectively married and in the age group 15-49 years and is a member of the household on the date of survey. In case of polygamy, each wife is considered to form a separate couple. In case of ployandy, the wife forms one couple with the husband with whom she is currently having marital relationship as her male partner.

3.5 Fractile-group : The fractile-groups used in this report are, in general, the percentile groups of 0-10, 10-20, 20-30, 30-40, 40-50, 50-60, 60-70, 70-80, 80-90 and 90-100. For table 1 of the appendix, 12 fractile-groups are used with the first two and last two fractile-groups each accounting for 5 per cent of the households. The households/population/eligible

couples are obtained using the following procedure

All the households belonging to a state/U.T. are arranged in the ascending order of their monthly per capita consumer expenditure and then the corresponding estimated number of households are cumulated to arrive at the total estimated number of households (M). The percentile groups are then worked out as 10 groups. each accounting for approximately 10 per cent of households (i.e., approximately $M/10$ households).

3.6 Adult female education level : Adult female education level relates to the highest education level among all adult female members of the household. The levels are - illiterate, literate but below primary, primary but below secondary and secondary & above.

Narayan/

Section Four

SUMMARY OF FINDINGS

4.1 The survey results revealed that there were about 1071 lakhs eligible couples in rural India and about 292 lakhs eligible couples in urban India during 1986-87. About 25 per cent of the eligible rural couples and nearly 30 per cent of the urban couples were protected (either accepted sterilisation or currently practising any one of the family planning methods) under family planning services. The relatively high couple protection rate (percentage of eligible couples protected from child birth due to adoption of family planning methods including sterilisation in the urban sector might be due to the better awareness of family planning services and availability of service facilities in that sector compared to rural sector.

4.2 Couple protection rate and level of living : Household monthly per capita consumption expenditure is a good indicator of the level of living. In order to study the relationship between couple protection rate and level of living the couple protection rates for different fractile groups (derived on the basis of household per capita consumer expenditure) are given in statement 4.1 separately for rural and urban India. It is observed that the couple protection rate increases with the increase in household per capita expenditure in both the rural and urban sectors of India. In the lowest fractile-group however, the couple protection rate was higher than that of next fractile-group. It is also observed that the couple protection rate through family planning services other than sterilisation increases with increasing household per capita expenditure in both sectors. During 1986-87 in rural India, this rate increased from about 3 per cent in the fractile-group 10-20 to about 9 per cent in the highest fractile-group. In urban India, it increased from about 5 per cent in the lowest group to about 20 per cent in the highest group. On the other hand, the percentage of couples ever sterilised remained almost constant over the fractile-groups. The urban couple protection rate is

Note :1. CPR - couple protection rate.

2. The figures in parenthesis give the percentage share of CPR by the respective family planning method.

observed to be consistently higher than the rural rate in all the fractile-groups.

4.3 Couple protection rate and social group : The couple protection rate by social group is presented in statement 4.2 for rural and urban India. The different social groups are scheduled tribe, scheduled caste, neo-Buddhist and others. The rate was highest among neo-Buddhists - about 30 per cent and 57 per cent respectively in rural and urban sectors. It was lowest among the scheduled tribes and scheduled castes - about 22 per cent in rural India and among the schedule tribes - about 30 per cent in urban India. It may be seen that the variation in the couple protection rate among social groups was considerably higher in urban India compared to rural India. As for the relative popularity of different couple protection methods, the sterilisation method was found to be favoured by a much higher percentage of protected couples - about 82 per cent in the rural sector and 71 per cent in the urban sector. Among the social groups, one which favoured the sterilisation method most was the neo-Buddhists. The lowest preference for sterilisation was shown by 'others'.

4.4 Couple protection rate and adult female education level : From the results on couple protection rate cross classified by adult female education given in statement 4.3, it is observed that there is a positive association between the couple protection rate and adult female education level. The couple protection rate is relatively higher in higher adult female education level in both rural and urban India. The rural rate was about 34 per cent in the "secondary and above" level and 21 per cent in the 'illiterate' level. The corresponding urban rates were respectively about 44 per cent and 27 per cent.

4.5 Regional variation of couple protection rate : With a view to studying the regional pattern of the couple protection rate, the relevant results are presented in statement 4.4. It can be seen from the statement that couple protection rate

Note : CPR - Couple protection rate.

varied considerably over the states and sectors. The rate was highest in Delhi-about 52 per cent. In rural sector, Delhi was followed by Maharashtra (45 per cent), Kerala (44 per cent) and Gujarat (40 per cent). In urban sector the states with relatively higher rates were Himachal Pradesh (51 per cent), Maharashtra (49 per cent), Punjab (49 per cent) and Kerala (48 per cent). On the other hand, the lowest couple protection rate prevailed in rural Orissa (2 per cent) followed by rural Manipur (5 per cent), rural Meghalaya (5 per cent), rural Lakshadweep (7 per cent) and urban Lakshadweep (8 per cent).

4.6 Category of service received by sterilised couples :

The percentage distribution of couples who were sterilised during last 365 days preceeding the date of survey by category of service received is presented in statement 4.5R for rural sector and in statement 4.5U for urban sector of each state and all-India. For the purpose of classification five categories of service were used, namely, with incentives from govt., free from govt., on payment from govt., free from other agencies and on payment from other agencies. It is seen that in rural India nearly 92 per cent of the couples who were sterilised during last 365 days preceeding the date of survey received the services from 'government' agency. The corresponding proportion in urban India was 87 per cent. Further, 71 per cent of the rural sterilised couples received the services with incentive from 'government' agency as compared to the corresponding proportion of 56 per cent for urban sterilised couples. Almost similar features are also observed in the rural and urban sectors of most of the states. However, in urban Himachal Pradesh and urban Goa, Damana & Diu, the percentage of sterilised couples who received the service on payment from 'other' agency was very high, about 55 per cent in Himachal Pradesh and 60 per cent in Goa, Daman & Diu.

4.7 Receipts of family planning tools : Percentage of non-sterilised couples who sought and received and also did not receive the various family planning tools are given in statement 4.6 separately for rural and urban sectors of India. Of the different family planning tools, 'nirodh' was observed to be the most preferred method by both rural and urban couples to control fertility followed by 'oral pills'. In urban areas, 'IUD' is also seen to be equally preferred as 'oral pills'. The percentage of non-sterilised couples who received 'nirodh' was about 5 in rural India and about 11 in urban India. Compared to 'nirodh', only about 2-3 per cent of the non-sterilised couples sought and received 'oral pills'. Almost a similar proportion of non-sterilised couples received 'IUD' in urban India. The other family planning tools, viz. 'diaphragm', 'spermicide', 'MTP' and 'injection' were sought and received by only less than 1 per cent of the non-sterilised couples. It is also seen that about 3-4 per cent of the non-sterilised couples sought but did not receive the various services.

4.8 Category of service received by non-sterilised couples in respect of different family planning tools received : The percentage distribution of non-sterilised couples who received different family planning tools by category of service received is given for each type of family planning tools in statement 4.7 separately for rural and urban India. It is observed that more than 50 per cent of non-sterilised couples received the requirement from non-government agencies in both rural and urban India except in the case of 'nirodh' and 'IUD'. Also, most of these couples received the services on payment from the non-government agencies. On the other hand, among the recipients of services from government agencies most of them received their requirement free except 'nirodh' and 'oral pills' which were received mainly on payment.

STATEMENT 4.6 : PERCENTAGE (0.00) OF NON-STERILISED COUPLES WHO SOUGHT AND RECEIVED AND DID NOT RECEIVE THE DIFFERENT FAMILY PLANNING TOOLS BY ITEM SOUGHT FOR RURAL AND URBAN INDIA.

4.9 In statements 4.8R and 4.8U, the percentage of non-sterilised couples who sought and received and also did not receive the family planning tools are given for each tool, and also separately for rural and urban sectors of states and all-India. This apart, the percentage distribution of non-sterilised couples who received various family planning tools by category of service received is given for each family planning tool. A considerable variation in the percentage of non-sterilised couples who sought and received the services over the states and sectors was observed for each family planning tool. Further, the distribution of non-sterilised couples who received the services over the categories of service received varied substantially over the states and sectors.

Section Five

EXPLANATORY NOTES ON APPENDIX TABLES

5.1 There are four detailed tables presented in the appendix of this report. Table 1 is presented for rural and urban sectors of each state/u.t. and all-India and the remaining three tables, i.e. tables 2 to 4 are presented only for rural and urban India. However, the key results on tables 2 to 4 are also provided for all-India and states in section 4.

5.2 Table 1 : This table gives the percentage of couples ever sterilised, sterilised during the last 365 days preceeding the date of survey and the percentage of couples who received family planning services other than sterilisation service separately for each fractile-group (based on household per capita consumption expenditure), adult female education level (i.e. highest education level among the adult female members of the household) and social group (i.e. scheduled tribe, scheduled caste, neo-Buddhist and others).

5.3 Table 2 : This table relates to the couples who were sterilised during ^{the} last 365 days preceeding the date of survey. It gives the percentage distribution of these couples by various category of service received (i.e. free from government, with incentive from government, on payment from government, free from other (i.e. non-government) agency and on payment from other agency) by fractile-group for each sterilisation method, namely, vasectomy and tubectomy.

5.4 Table 3 : Table 3 gives the percentage distribution of non-sterilised couples by category of service received for each fractile group and social group. This information is also given separately for each family planning tool. Columns 2 to 6 of this table relate to the non-sterilised couples who sought and received the family planning services. Columns 7 & 8 relate to the non-sterilised couples who sought the family planning service but did not receive and column 9 relates to those who did not seek family planning service.

5.5 Table 4 : This table is similar to table 3 in format and gives the percentage distribution of non-sterilised couples by fractile-group for each category of service received and for each family planning tool.

Faint, illegible text, possibly bleed-through from the reverse side of the page. The text is arranged in several paragraphs and is difficult to decipher due to its low contrast and blurriness.

TABLE (1.0) : PERCENTAGE (0.00) OF COUPLES EVER STERILISED, STERILISED DURING LAST YEAR AND RECEIVED FAMILY PLANNING SERVICE BY FRACTILE GROUP, SOCIAL GROUP AND ADULT FEMALE EDUCATION CLASS FOR RURAL AND URBAN SECTORS OF EACH STATE AND ALL-INDIA
