## PREFACE

The National Sample Survey Organisation(NSSO) has been engaged in the collection of data on household consumer expenditure through sample surveys since 1950. The objective of this survey was to fill up the data gaps for the purpose of National Income estimation. The NSSO conducted consumer expenditure surveys regularly in every round from its first round(1950-51) to the 28th round(1973-74) and provided a long series of data on consumer expenditure based on all these rounds.

After the 26th round of NSS, the Governing Council of NSSO decided that the surveys on consumer expenditure would be conducted once every five years so that the needs of data on other important subjects can be met. Under this programme, the first quinquennial survey on consumer expenditure was conducted in the 27th round(1972-73). Then quinquennial survey has been repeated in the 32nd round(1977-78), the 38th round (1983) and also the 43rd round(1987-88). To meet some ad hoc requirements, a survey on consumer expenditure was also conducted in NSS 28th round (1973-74). The basic concepts, definitions and the method of data collection have remained essentially stable throughout this period.

The 43rd round survey on consumer expenditure was conducted between July 1987 and June 1988 in 8321 sample villages and 4583 sample blocks; and 10 households were surveyed in each sample village and block. A noteworthy feature of this round is that in order to net sufficient number of sample households from upper income classes, some changes were incorporated in the sample design. So far three reports have been finalised based on data of sub-sample 1, NSS 43rd round. They are :

- (i) Report no.372 : Pattern of consumer expenditure,
- (ii) Report no.373 : Particulars of dwelling unit and
- (iii) Report no.374 : Pattern of consumption of cereals, pulses, tobacco and some other selected items.

The present report is the fourth one and is based on data of both sub-sample 1 & 2.

This report presents the important results on the pattern of consumer expenditure of different socio-economic groups of households in the country and in different States, i.t.'s.

A facsimile of schedule 1.0, NSS 43rd round and a list of Working Group Members who finalised the concepts, definitions, sample design and the tabulation plan of the survey have been appended with this report.

This report is a product of the co-ordinated-teamwork of the Working Group Members, all the divisions of NSSO and computer centre. The SDR Division has prepared the sample design, survey schedules, instruction manual, tabulation programme and finally prepared the report, the Field Operation Division has collected data with strenuous effort, the Data Processing Division has validated all the data tapes with utmost care and the computer centre has tabulated the survey results neatly as per the tabulation programme.

I am really happy to record my sincere appreciation to all persons who were actively engaged in carrying out the coordinated teamwork for timely completion of this report.

Any comments/suggestions for improvement of this report are welcome.

S.RAY  
Director, SDRD

List of the members of the Working Group of the NSS 43rd round surveys

1. Prof. Pravin Visaria, Director, Gujarat Institute of Area Planning, Gota, Ahmedabad. Chairman
2. Prof. A.V. Vaidyanathan, 79, Second Main Road, Gandhi Nagar, Adyar, Madras - 600 020. Member
3. Prof. K. Sundaram, Delhi School of Economics, University of Delhi, Delhi - 110 007. Member
4. Prof. N. Bhattacharya, Indian Statistical Institute, 203, B.T. Road, Calcutta- 700035. Member
5. Prof. T.J. Rao, Indian Statistical Institute, 203, B.T. Road, Calcutta - 700 035. Member
6. Dr.(Mrs.) R. Thamarajakshi, Adviser(LEN), Planning Commission, New Delhi. Member
7. Shri S.M. Vidwans\*, Director of Economics & Statistics, Member Govt. of Maharashtra, Bombay.
8. Shri K. Lakshminarayana, Director, Bureau of Economics & Statistics, Govt. of Andhra Pradesh, Hyderabad. Member
9. Shri N.K. Rajagopalan, Executive Director, Computer Centre, Deptt. of Statistics, New Delhi. Member
10. Shri S. Natarajan, Joint Director, Central Statistical Organisation, New Delhi. Member
11. Shri S. Ray, Director, Data Processing Division, NSSO, 164, G.L. Tagore Road, Calcutta-700 035. Member
12. Shri M. Neelakantan, Officer-on-Special-Duty, Field Operations Division, NSSO, New Delhi. Member
13. Shri H.L. Jain, Deputy Director, Field Operations Division, NSSO, Jaipur. Member
14. Shri S. Sengupta\*\*, Officer-on-Special-Duty, Survey Design & Research Division, Calcutta. Convener

A Sub-Group of the Working Group was set up to finalise the tabulation plan on the NSS 43rd round surveys. The sub-group consisted of the following members :-

1. Prof. Pravin Visaria, Chairman,
2. Shri S. Sengupta, Member
3. Shri Paul Jacob, Convener
4. Shri K.P. Chatterjee, DD, SDRD, NSSO, Calcutta.

\* Shri V.D. Mahajan was subsequently co-opted in place of Shri S.M. Vidwans.

\*\* on retirement of Shri S. Sengupta, Shri Paul Jacob, Jt. Director was co-opted as the Convener.

NATIONAL SAMPLE SURVEY : 43RD ROUND. (JULY 1987 - JUNE 1988)

REPORT ON THE FOURTH QUINQUENNIAL SURVEY ON CONSUMER EXPENDITURE :  
LEVEL AND PATTERN OF CONSUMPTION OF DIFFERENT SOCIO-ECONOMIC GROUPS  
OF HOUSEHOLDS

SECTION ONE

INTRODUCTION

1.0 Data on household consumer expenditure were being collected in every round of the National Sample Survey Organisation (NSSO), beginning from the first round (October 1950 - March 1951) through the 28th round (1973-74). After the 26th round of the survey, the Governing Council of NSSO decided that the survey on Consumer Expenditure and Employment & Unemployment be undertaken together once in five years beginning from the NSS 27th round. Thus, the first quinquennial survey on consumer expenditure was conducted in the 27th round (September '72 - October '73). To meet some specific ad.hoc requirements, a survey on consumer expenditure was also conducted in the 28th round outside this quinquennial programme. The second and third quinquennial surveys on consumer expenditure were conducted during NSS 32nd round (July '77 - June '78) and 38th round (January - December '83) respectively.

Beginning with the 42nd round <sup>2/</sup> (July '86 - June '87), once again it was decided to conduct the survey every year, although on a relatively smaller scale than is normally being done in the quinquennial surveys, with a view to building up a time series of consumer expenditure data. The second survey in the annual series <sup>3/</sup> was conducted during the NSS 44th round (July '88 - June '89).

- 
- 1/ The results of the NSS 27th, 32nd & 38th rounds of survey on consumer expenditure have been published in Sarvekshana vol.II, No.3, vol.IX, No.3 and No.4 respectively.
  - 2/ For the report see Sarvekshana, vol.XII, No.4, Issue No.39.
  - 3/ The results of 44th round based on the first two sub-rounds were published in special report No.2 'Key results of consumer expenditure survey', first semi-round (July '88 - December '88) of NSS 44th round; the report No.370/2 gives the data for the entire round.

The third survey of the annual series <sup>4/</sup> was carried out in the 45th round (July 1989 - June 1990).

The present report is based on the data collected in the 43rd round, that is, the fourth quinquennial survey on consumer expenditure, during July '87 - June '88, from both sub-samples 1 and 2.

1.1 In the 43rd round, data on consumer expenditure were collected from about 1.28 lakhs of households from rural and urban areas. Because of the large volume of tabulation some important priority tables were first generated from the data of sub-sample 1. Three reports <sup>5/</sup> based on these priority tables have already been released.

1.2 Further, it was decided that some of the other tables from the tabulation plan based on sub-sample 1 and 2 would be generated on a priority basis and some reports would be prepared on that. At the first instance it was planned to prepare three reports based on a set of 15 tables. The present report is the first of this kind and gives the basic results on the pattern of consumer expenditure of different socio-economic categories of households.

1.3 This report contains four sections and two appendices. Section One, introduction, describes some general aspects of survey. Section Two briefly outlines, the sample design and the estimation procedure of the survey. Section Three gives some salient features of the conceptual framework and the definitions adopted for the survey. Section Four presents important summary results. Appendix I gives the detailed tables for the country as a whole. It is followed by a facsimile copy of schedule 1.0 canvassed in the 43rd round as Appendix II.

- 
- 4/ The results of the NSS 45th round have been published in Sarvekshana vol. XVI, No. 1, Issue No. 52.
- 5/ The results of the NSS 43rd round based on sub-sample 1 have been published in Sarvekshana vol. XV, No. 1, Issue No. 48, vol. XVI No. 1, Issue No. 52 and NSS Report No. 374 : "Patterns of consumption of cereals, pulses, tobacco and some other selected items".

SECTION TWO  
SCOPE, COVERAGE AND SAMPLE DESIGN

2.0 A noteworthy feature of this round is that in order to net sufficient number of households belonging to the upper income classes in the sample some significant changes have been made in the sample design. Details of the geographical coverage, sample design etc., are given below :

2.1 Geographical Coverage : The 43rd round survey covered the whole of the Indian Union except (i) Ladakh and Kargil districts of Jammu & Kashmir and (ii) rural areas of Nagaland.

2.2 Sample Design : A two-stage stratified sampling design was adopted for the survey with the first stage units as census villages for rural areas and the urban frame survey blocks for urban areas. Households formed the second stage units in both rural and urban areas.

2.3 Stratification : Each state/union territory (U.T.) was divided into one or more agro-economic regions by grouping contiguous districts which are similar with respect to population density and crop pattern. In Gujarat, however, some districts were sub-divided for the purpose of region formation in consideration of the location of dry areas and the distribution of the tribal population in the state. The total number of regions formed in the whole of India was 77. In the rural sector, within each region, each district with a rural population of less than 1.8 million according to the 1982 census formed a single basis stratum. Districts with larger population were divided into two or more strata, depending on population, by grouping contiguous tehsils, similar as far as possible, in respect of rural population density and crop pattern. In Gujarat, however, in the case of districts (partly) included in more than one region, the portion of a district in each region constituted as separate stratum, even if the rural population was less than 1.8 million. Further, in Assam, where the 1981 census was not conducted, the 'basic strata' formed

for the earlier surveys on the basis of the 1971 census rural population, but with cut-off population as 1.5 million, were retained as the strata for rural sampling. In urban areas, strata were formed, again within NSS regions, on the basis of the population size class of towns. First, each city with a population of 10 lakhs or more was taken as a self-representative area. The remaining towns of each region were divided into the following four size classes on the basis of population of : (1) less than 50,000, (2) 50,000 to less than 2 lakhs, (3) 2 lakhs to less than 4 lakhs and (4) 4 lakhs to less than 10 lakhs. Towns with a population of 4 lakhs or more and each of the cities with population of 1 million or more were further divided into two parts viz., (a) areas with a concentration of the relatively affluent section of the population and (b) the remaining areas. The strata were then formed as detailed below :

stratum number	class of town according to size of population
(1)	(2)
1	all towns with population less than 50,000
2	50,000 - 199,999
3	200,000 - 399,999
4	400,000 - 999,999 (affluent area)
5	" (other area)
6	a single city with population 1 million and above (affluent area)
7	" (other area)

It may be noted that there was no region with more than one city with a population of 1 million and above. The stratum numbers were retained as above even if in some regions some of the strata were non-existent. Further, all the urban areas of the union territory of Delhi Municipal Corporation, New Delhi Municipal Corporation, Delhi cantonment area and the villages treated as urban areas in the 1981 census were considered as constituting the city of Delhi.

2.4 Allocation of samples : A total all-India sample of 13166 first stage units (8518 villages and 4648 urban blocks) was first allocated to the states/union territories in proportion to the central field staff available in each of them. The sample thus obtained for each state/u.t. was then re-allocated to the rural and urban sectors of the state/u.t. considering the relative sizes of the rural and urban population. Within each state/u.t. the rural sample was again allocated to the rural strata of the state/u.t. in proportion to the rural population in them. Similarly, the urban sample of a state/u.t. was allocated to the urban strata of the state/u.t. in proportion to the urban population in them but with double weightage assigned to those strata comprising of areas inhabited by the relatively affluent sections in towns with population 4 lakhs or more. All allocations were adjusted such that the sample size for a stratum was at least a multiple of 4 (preferably a multiple of 8) and the total sample size of a region was a multiple of 8 for the rural and urban sectors separately to have equal samples in each sub-sample and sub-round.

2.5 Selection of first stage units : In the rural sector, the sampling frame was 1981 census list of villages in most cases. However, in some areas where either 1981 census was not undertaken or the available list was highly deficient, 1971 census frames were used. In the urban sector, the sampling frames used were the block lists of the most recent NSS urban frame survey available for each town. The sample villages were selected circular systematically with probability proportional to size (population) in the form of two independent sub-samples. The sample blocks were selected circular systematically with equal probability, also in the form of two independent sub-samples.

2.6 Selection of second stage units(households) : In order to ensure adequate representation of households from the affluent section of the society in the sample, the following procedures were adopted for the selection of sample households. In the rural sector, the households in each sample village were first grouped into two sub-strata. Sub-stratum 1 consisted of 8 or 10 relatively most affluent households depending on whether the sample village had less than 80 households or 80 or more households. The remaining households formed sub-stratum 2. Two sample households were selected from sub-stratum 1 circular systematically with a random start. In the case of sub-stratum 2, before selection of the sample, the households were grouped into three means of livelihood (m.l.) classes; namely, (1) self-employed in non-agriculture, (2) rural labour and (3) others, on the basis of the major source of income during the 365 days preceding the date of survey. The households of the last class were again grouped into five land possessed classes, viz., households possessing (1) less than 1 acre, (2) 1 to 2.49 acres, (3) 2.5 to 4.99 acres, (4) 5 to 9.99 acres and (5) 10 acres and above. Eight households were then selected, also circular systematically

with a random start, after arranging the households belonging to the different groups in a continuous manner. In the urban sector also, two sub-strata of households were formed in each sample block. In all the cities with a population of 10 lakhs or more, households with monthly per capita expenditure (MPCE) of Rs.1000/- or more constituted sub-stratum 1 and the remaining households constituted sub-stratum 2. On the other hand, in towns with a population of less than 10 lakhs, sub-stratum 1 consisted of households with a MPCE of Rs.800/- or more and the rest constituted sub-stratum 2.

~~For the selection of the sample households, all the households of sub-stratum-2~~ For the selection of the sample households, all the households of sub-stratum-2 were first grouped into four means of livelihood classes namely (a) self-employed, (b) regular wage/salary earning, (c) casual labour and (d) others. The households of the groups (a) and (b) were again re-grouped as belonging to three monthly per capita expenditure levels - (i) less than 'A', (ii) 'A' to 'B' and (iii) above 'B' where A and B were the MPCE cut-off levels obtained separately for each state and union territory such that the population with MPCE less than A, A to B and above B respectively constituted of approximately the lowest 30 per cent, the middle 60 per cent, and the top 10 per cent. The sample households were then selected after arranging the households belonging to different groups in a specified manner. In blocks belonging to the strata consisting of an affluent area, 4 sample households were selected from sub-stratum 1 and 6 households from sub-stratum 2. In the blocks belonging to the remaining strata, 2 households were selected from sub-stratum 1 and 8 households from sub-stratum 2. The required number of sample households was selected circular systematically with a random start separately from each sub-stratum.

2.7 Survey period and sub-rounds : The field work for the survey was started in the month of July 1987 and completed in June 1988. The entire survey period of one year was divided into four sub-rounds of three months each coinciding approximately with the four seasons. The four sub-round periods were as follows :

Sub-round 1	: July '87 - September '87
Sub-round 2	: October '87 - December '87
Sub-round 3	: January '88 - March '88
Sub-round 4	: April '88 - June '88

The samples were distributed over the four sub-rounds in a manner so as to provide equally valid estimates for the country for each of the sub-round periods separately.

2.8 Sample size : The survey covered a combined sample of about 1 lakh 28 thousand households spread over 8321 sample villages and 4583 sample blocks. Statement 0 gives the distribution of sample villages/blocks allotted and surveyed and the number of sample households and persons surveyed for each state and union territory. And Statements O.1R and O.1U give the number of surveyed households by state/u.t., occupational type and social group (see para 3.8).

2.9 Estimation procedure : The estimation procedure adopted in the NSS 43rd round is based on weighted sum of the sample values. Denoting by  $\hat{Y}$  the unbiased estimate of  $Y$  (the state/region total of any variate), it is given by:

$$\hat{Y} = \sum_s \frac{p_s}{n_s} \sum_{i=1}^{n_s} \frac{d_{si}}{c_{si}} \sum_{k=1}^2 \frac{h_{sik}}{h_{sik}} \sum_{j=1}^{h_{sik}} y_{sikj} \quad \dots \dots \dots (1)$$

for the rural sector except Arunachal Pradesh; by

$$\hat{Y} = \sum_s \frac{n_s}{n_s} \sum_{i=1}^{n_s} \sum_{k=1}^2 \frac{h_{sik}}{h_{sik}} \sum_{j=1}^{h_{sik}} y_{sikj} \quad \dots \dots \dots (2)$$

For rural Arunachal Pradesh; and by

$$\hat{Y} = \sum_s \frac{n_s}{n_s} \sum_{i=1}^{n_s} d_{si} \sum_{k=1}^2 \frac{h_{sik}}{h_{sik}} \sum_{j=1}^{h_{sik}} y_{sikj} \dots \dots \dots (3)$$

for the urban sector, where  $s$ ,  $i$ ,  $j$  and  $k$  are suffixes for stratum, village/block, household and sub-stratum respectively;

$p_s$ ,  $n_s$  and  $n_s$  give the stratum values of selection population, number of villages/blocks in the frame and number of sample villages/blocks respectively;

$d_{si}$ ,  $c_{si}$ ,  $p_{si}$  stand for number of hamlet-groups/sub-blocks formed, number of census villages contained in a revenue village actually surveyed and the selection population of the sample village respectively;  $h_{sik}$  and  $h_{sik}$  stand for the total number of households listed and the number of sample households respectively and  $y_{sikj}$  is the observed value of the variate for a sample household.

2.10 Estimates of ratios : The estimate of a ratio of the form :

$R = Y/X$  where  $x$  and  $y$  are the population totals of two characteristics  
is given by

$$\hat{R} = \frac{\hat{Y}}{\hat{X}}, \text{ where}$$

$\hat{Y}$  &  $\hat{X}$  are obtained using the formulae : already given at the level at which  $R$  is required. That is to say, if  $R$  is required at state level,  $Y$  and  $X$  are first obtained at state level and then  $R$  will be obtained by division.  
Examples of ratios are rates and percentages.

2.11 Sub-sample and sub-round estimates : The estimates of aggregates of a given sub-sample/sub-round are computed using the same formulae as given above with the only modification that the tabulation is restricted to the sample f.s.u's of that sub-sample/sub-round. The value of  $n_s$  to be used in this case is the number of f.s.u's of the sub-sample/sub-round in question available for tabulation. The combined sample estimate of aggregate is based on the whole sample and not computed as the average of the sub-sample/sub-round estimates.

## SECTION THREE

## CONCEPTS AND DEFINITIONS

3.0 The concepts and definitions followed in the consumer expenditure enquiries have continued to remain broadly the same as in the earlier NSS rounds. Some of these concepts and definitions are described below :

3.1 Household : A group of persons normally living together and taking food from a common kitchen constitutes a household. A boarding house, a hostel or a hotel is treated as a cluster of households, where each individual boarder forms a household. Households fed directly by some institutional bodies such as those in prisons, police quarters, cantonments, hospitals, asylums, relief camps are, however, excluded from the scope of the survey. Floating population having no normal place of residence and the households of foreign nationals are also excluded.

3.2 Household members : Any person who is a normal resident of the sample household is considered a member of the household. Household members are grouped into three categories viz., adult males, adult females and children. One who has already attained the age of 15 (in completed years) is considered as an adult. Any person who usually lives and takes the principal meals with the household is considered a member of the household.

3.3 Household size : The total number of members (as defined above) in a household is considered to be the size of the household.

3.4 Household consumer expenditure : The expenditure incurred by a household on domestic consumption during the reference period is the household's consumer expenditure. The household consumer expenditure is the total value of consumption of various groups of items, namely (i) food, pan (betel leaves) tobacco, intoxicants and fuel & light, (ii) clothing and ~~footwear~~<sup>footwear</sup> and (iii) miscellaneous goods and services and durable articles.

For groups (i) and (ii), the total value of consumption is derived by aggregating the monetary value of goods actually consumed during the reference period. An item of clothing and footwear would be considered to have been consumed, if it is brought into maiden or first use during the reference period. The consumption may be out of (a) purchases made during the reference period or earlier; (b) home grown stock; (c) receipt in exchange of goods and services; (d) any other receipt like gift, charity, borrowing and (e) free collection. For evaluating the consumption of the items of group (iii) i.e. items categorised as miscellaneous goods and services and durable articles, a different approach is followed. In this case, the value of actual purchase i.e. the expenditure incurred during the reference period for the purchase of goods and services is considered as consumption.

It is pertinent to mention here that the consumer expenditure of a household on food items relates to the actual consumption made by the normal resident members of the household and also by the guests during ceremonies or otherwise. To avoid double counting, transfer payments like charity, loan, advance etc., made by the household are not considered as consumption for items of groups (i) and (xi), since transfer <sup>receipts</sup> of those items have been taken into account. However, the item "cooked meals" is an exception to the rule. Meals prepared in the household kitchen and provided to the employees and/or others would automatically get included in domestic consumption of employer (payer) household. There is a practical difficulty of estimating the quantities and values of individual items used for preparing the meals served to employees or to others. Thus, to avoid double counting, cooked meals received as perquisites from employer household or as gift or charity are not recorded in the recipient household. As a general principle, cooked meals purchased from the market for the consumption of the normal resident members or for the guests and employees will also be recorded in the purchaser household. This procedure of recording cooked meals served to others in the expenditure of the serving households only leads to bias-free estimates of average per capita consumption as well as total consumer expenditure. However, as the proportions of donors and recipients of free cooked meals are likely to vary in opposite directions, over the expenditure classes, the nutritional intake derived from the consumer expenditure survey data may present a somewhat distorted picture. These estimates of nutrition intake may be inflated for the rich (net donors) and understated for the poor (net recipients). This point has to be kept firmly in mind while using the NSS consumer expenditure data for any nutritional study.

**3.5 Reference period :** The reference period for the collection of data on all items of consumer expenditure is the last 30 days (ending on the day preceding the date of enquiry). For some non-food items data were collected also for the last 365 days; but this report is based on data collected for the last 30 days for all items.

**3.6 Monthly per capita expenditure (MPCE) :** The total consumer expenditure of a household divided by the household size is taken as the monthly per capita expenditure (MPCE) of the household and its members.

**3.7 Monthly per capita expenditure class :** The households and persons are classified according to their monthly per capita expenditure. The expenditure classes (in rupees) have been arranged in an ascending order of their magnitudes. The derived MPCE levels are grouped into 12 classes. For presentation of the 43rd round results the grouping formulated on the basis of a trial tabulation of the NSS 43rd round data has been adopted. The groups were formulated in such a way as to obtain approximately 5 percent of

Letter and other non-schedule areas - Rural areas and urban areas

the population each in the first two and the last two classes and 10 percent each in the middle eight classes. Such a formulation has led to different expenditure classes for rural and urban areas.

The MPCE classes for rural areas are :

Srl. no.	monthly per capita expenditure (MPCE) class (in rupees)	Srl. no.	monthly per capita expenditure (MPCE) class (in rupees)
(1)	(2)	(1)	(2)
1.	less than 65	7.	140 - 160
2.	65 - 80	8.	160 - 180
3.	80 - 95	9.	180 - 215
4.	95 - 110	10.	215 - 280
5.	110 - 125	11.	280 - 385
6.	125 - 140	12.	385 & above
13.			all classes

The MPCE classes for urban areas are :

Srl. no.	monthly per capita expenditure (MPCE) class (in rupees)	Srl. no.	monthly per capita expenditure (MPCE) class (in rupees)
(1)	(2)	(1)	(2)
1.	less than 90	8.	255 - 310
2.	90 - 110	9.	310 - 385
3.	110 - 135	10.	385 - 520
4.	135 - 160	11.	520 - 700
5.	160 - 185	12.	700 & above
6.	185 - 215	13.	all classes
7.	215 - 255		

contd.....

It has been decided that once in every five years, the MPCE classes will be formulated on the basis of trial tabulation of the quinquennial survey data. These classes will be retained for the subsequent four annual rounds to help study the shift in the distribution of the population. As the classes are different for the rural and urban areas, it becomes difficult to combine the rural and urban results or compare the rural distribution with the urban distribution.

However, class intervals for monthly per capita expenditure are so demarcated that some class limits are common for both the sectors and thereby facilitate comparisons of rural and urban distributions for some broad MPCE classes. For the 43rd round, rural-urban comparisons can easily be made for the MPCE classes, 110, 110-160, 160-215, 215-385 and 385 & above.

3.8 Socio-economic groups : Tabulation of the 43rd round data permit an analysis of the pattern of consumer expenditure according to important household characteristics. For rural households, these characteristics are : (i) social group

~~(ii) social group~~ (iii) household type and (iii) size of land possessed by the household. The urban households have been classified by two characteristics : (i) social group and (ii) household type. The following are the detailed specifications of the classification characteristics used in forming the socio-economic groups of households.

1. Household type (item 6 of block 3.1)

(a) <u>Rural sector</u>	(b) <u>Urban sector</u>
1. Self-employed in non-agriculture	1. Self-employed
2. Agricultural labour	2. Regular wage/ salary earner
3. Other labour	3. Casual labour
4. Self-employed in agriculture	4. Other households
5. Other households	5. All households
6. All households	

2. Social group (item 5 of block 3.1)

For both rural and urban sector

1. Scheduled tribe
2. Scheduled caste
3. Neo-Buddhist
4. Other households
5. All households

3. Size of land possessed class (item 11 of block 3.1)

For rural sector

1. less than 0.01 hectare
2. 0.01 - 0.40 hectare
3. 0.41 - 1.00 hectare
4. 1.01 - 2.00 hectare
5. 2.01 - 4.00 hectare
6. 4.01 & above
7. all

NB. Here it may be mentioned that the summary findings in Section Four of this report are xxxxxxxx based on the households for which all the above three characteristics are recorded in ~~the~~ Schedule 1.0.

SECTION FOUR

SUMMARY FINDINGS

4.0 We now attempt to summarise the main findings of this report. Here we shall discuss briefly the variation of household per capita consumer expenditure over (a) States/Union territories of rural and urban India (b) size of land possessed by the household (c) household (occupational) "types" (e.g. wage/salary earner, self-employed in agriculture, etc.) and (d) household (social) "groups" (SC/ST/Others). In most of the discussion we do not go into itemwise break-up of consumer expenditure but concentrate instead on total (all items) household monthly per capita consumer expenditure (MPCE). The classification of households into "types" is not the same for rural and urban households. The different types are listed in paragraph 3.8. In what follows, the term "major States" refers to the following 15 states of India : Andhra Pradesh, Assam, Bihar, Gujarat, Haryana, Karnataka, Kerala, Madhya Pradesh, Maharashtra, Orissa, Punjab, Rajasthan, Tamil Nadu, Uttar Pradesh and West Bengal.

4.1 Distribution of persons by monthly per capita consumer expenditure :

4.1.1 Statements IR and IU take a brief look at per thousand distribution of persons by MPCE in different states of rural and urban India respectively. Differences between major States seem most noticeable in the lowest two MPCE classes in both rural and urban sectors. Adding the figures in columns (2) and (3) of Statement IR, we find that in rural areas persons had MPCE below Rs. 80 whereas the corresponding number was much lower in Punjab (7), Haryana (22), Assam (33), Kerala (41) and Gujarat (50). Again, adding column (2) and column (3) figures of Statement IU, urban areas of Bihar and Uttar Pradesh had more than 200 out of every 1000 persons with MPCE below Rs. 110 while the number of such persons is considerably less in Punjab (35), Assam (50), Haryana (67) and Gujarat (68) among the major States.

4.1.2 As for differences in the upper end of the MPCE range, in rural Punjab nearly 600 persons out of 1000 had MPCE exceeding Rs. 180 (adding columns (10), (11), (12), and (13) of Statement IR) and Haryana had 535 persons in this category, while most other major States had less than 250. In the top MPCE brackets, Punjab led in the urban sector as well, though not to the same extent as in the rural sector.

STATEMENT 1R : PER 1000 DISTRIBUTION OF PERSONS BY MONTHLY PER CAPITA EXPENDITURE CLASS  
FOR DIFFERENT STATES/U.T.'S IN RURAL AREAS

4.2 Consumer expenditure and size of land possessed (rural sector) :

4.2.1 Agriculture being the mainstay of rural India, land is the most important asset in the rural sector. The distribution of households by land possessed (see Statement 2R) is generally a good indicator of the level of living of rural households. This would be confirmed if we were to find a rising trend in ~~MPCE~~ ... with size of land possessed. Statement 3R attempts to see whether such a trend exists.

4.2.2 It can be seen from Statement 2R that the highest proportion of rural households was in the size class "0.01 to 0.40 hectares" in nearly all the major States. In India as a whole, 38% of all households belong to this size class. The percentage of households in this class was below 25% only in Rajasthan, Maharashtra and Madhya Pradesh among the major States.

4.2.3 Turning to Statement 3R, we see that from the second lowest size class onwards, that is, from 0.01 hectares onwards, a rise in ~~MPCE~~ ... with size of land possessed is more or less clear for all-India as well as for most of the major States. This confirms the impression that land possessed and level of living are closely connected in rural India. The rising trend is more pronounced in some States, e.g. Tamil Nadu, Kerala, Punjab and Haryana than in others, e.g., Assam, Gujarat, Karnataka and Madhya Pradesh. That the lowest size class does not conform to this trend is probably because some households in this class are engaged in activities other than agriculture and are not poor.

4.2.4 In view of the limited importance of agriculture in the urban economy, land possessed does not appear to be a suitable indicator for studying the level of living of urban households. Therefore, Statements 2 and 3 are not presented for the urban sector.

**4.3 Level of consumer expenditure by household "ctype" :**

- 4.3.1 The numerical importance of different household types in rural and urban areas of different States/Union Territories is first studied in Statement 4R and 4U. Next the average M.P.C.E. (on all items together) of each household type is presented for the different States/U.T.'s in the rural and urban sector (Statements 5R and 5U).
- 4.3.2 For studying the differentials in the consumption levels the households are grouped into different "types" on the basis of the major source of income derived from gainful activities pursued by the different members during the 365 days preceding the date of survey. As indicated in para 3.8, the "types" into which the households were grouped are : self-employed in non-agriculture, self-employed in agriculture, agricultural labour, other labour and others in rural areas; and self-employed, regular wage/salary earners, casual labour and others in urban areas.
- 4.3.3 In rural India (Statement 4R), nearly 400 out of every 1000 households are seen to be "self-employed in agriculture"; in quite a few major States around 50% of all households belong to this type. "Agricultural labour" households come next (around 30% of all households). "Self-employed in non-agriculture", "other labour" and "other households" numerically form three minor household types in the rural sector. Rajasthan, Haryana, Uttar Pradesh and Assam appear to have a much lower proportion of "agricultural labour" households than other States. Rajasthan and Kerala have proportionately more than double the proportion of "other labour" households than other States.
- 4.3.4 In urban areas (Statement 4U) "regular wage/salary earners" form the largest household type, accounting for 44% of all households. 33% of all households are "self-employed" while "casual labour" and "other households" are small groups. Inter-State differences in the type distribution are far less marked in urban areas than in the rural sector. Kerala and to some extent all the southern States have a higher proportion of "casual labour" households than other States.

STATEMENT 4R : PER 1000 DISTRIBUTION OF HOUSEHOLDS BY HOUSEHOLD TYPE FOR DIFFERENT STATES/U.T.'S IN RURAL AREAS

JR.

4.3.5 From Statement 5R it is clear that among rural households, "agricultural labour" households have the lowest average MPCE (Rs. 121.12) and "other labour" households come next (Rs. 143.78).

The self-employed, both in agriculture and non-agriculture, are close to the all-households average of Rs. 157.66 in MPCE , while "other households" (Rs. 213.77) are appreciably above the all-households average. The same pattern is seen in all the major States ~~follows this pattern except~~ ~~glossy~~ except Punjab, where households "self-employed in agriculture" have a higher average MPCE than all other household types.

4.3.6 Statement 5U shows that in urban areas, "regular wage/salary earner" households and "other households" have a higher average MPCE (Rs. 286.18 and Rs. 278.47 respectively) than the other households. The "self-employed" have MPCE close to the average (Rs. 245.77) while "casual labour" households (Rs. 150.51) are considerably far behind.

The pattern is the same in all the major States.

#### 4.4. Differences in Consumer expenditure between scheduled and other :

4.4.1 Having already examined consumer expenditure variation over household types, the next question is whether household groups, too, differ in average MPCE . In rural areas, Statement 6R shows average m.p.c.e. of each type-group combination using an additional classificatory variable, viz., size of land possessed. Ignoring the land factor for the moment, we note from item 6, column(9) that average MPCE . of Scheduled Tribe households (Rs.123.04) is lower than that of Scheduled Caste households (Rs.133.35) and both the figures are appreciably lower than the average for the non-SC/ST (Rs. 169.23). Moreover, items 1 to 5, column (9) reveal that <sup>occupational</sup> pattern of differences in level of living is seen in all household/groups considered in Table 6R.

4.4.2 Statement 7U presents the average MPCE as well as distribution of persons by household type and group, for urban areas. The urban SC households are the most badly off in terms of average MPCE (Rs.185.03) the ST households come next (Rs.201.79) and the highest average MPCE is reported by non-SC/ST households (Rs.256.50). Again the <sup>occupational</sup> same pattern of differences is evident in all groups of households by <sup>occupational</sup> type. The disparity between SC/ST and non-SC/ST households seems to be of the same order in both rural and urban sectors.

Scheduled caste includes neo-Buddhist. MPCE : average monthly per capita total expenditure.

4.5.3 Among household groups, too, we have seen that ST households had the lowest average MPCE followed by SC households and "other" households. Item 6 of Statement 8R shows that the SC group has proportionately many more households than other groups in the lowest two size classes and therefore a much lower average value of size of land possessed per household than the other two groups.

4.6 Differences in the pattern of consumer expenditure among household types and groups :

4.6.1 We come now to the composition of household consumer expenditure, viz. food, clothing, durable goods, etc., and proceed to examine differences in these components over household types and groups. We have noted (paragraphs 4.3 and 4.4) the variations that exist in total MPCE among household types and household groups in both rural and urban areas. These variations in level of living are bound to be reflected in the different components of consumer expenditure as well. Our interest now will be rather to see whether there are any additional inter-type or inter-group variations in these components which cannot be explained purely in terms of differences in level of living.

4.6.2 Statements 9R and 9U show average monthly PCE under different heads of consumption expenditure by household type and household group in rural and urban India. Comparing the "total" rows of Statement 9R, it can be seen that (a) per capita expenditure on cereals is roughly the same among all household types (varies between Rs. 39 and 43) (b) differences among household types in MPCE arise because of varying expenditure on the other item groups appearing in the statement, namely food items other than cereals, clothing, footwear and durable goods, among the types (see column (9)).

4.6.3 Coming to inter-group variation in the rural sector, item 6 of Statement 9R similarly shows that (a) monthly per capita expenditure on cereals is invariant (around Rs. 41) over household groups (b) variation among household groups follows the pattern of variation of total MPCE among household groups (see column (9)).

4.6.4 For the urban sector, Statement 9U shows that per capita expenditure on cereals is stable among all household types and groups (around Rs. 37). "Regular wage/salary earners" seem to be spending more on durables, and "other households" less, relative to the all-household average, than their total MPCE would lead us to expect. Very little is revealed about household group differences in spending on food, clothing, etc. that is not explained by differences in total MPCE of household groups (column (9)).

4.6.5 Statements 10R and 10U show per capita expenditure on cereals and on all food items together as percentages of per capita expenditure on all items for the different household type - group combinations. Some facts emerge from statement 10R which were not very apparent from Statement 9R. One is that "agricultural labour" households spend nearly 33% of their total expenditure on cereals, compared to about 25% for all other household types except "other households", who allocate around 20% of their expenditure to cereals. However, the proportion of the budget allocated to food by different rural household types ranges between 60 and 67 per cent. Variations in expenditure on non-cereal food lead to the latter result.

4.6.6 Coming to household group variation in rural areas, ST households, especially those engaged in agriculture, report the highest proportion of cereals expenditure (more than 33% taking all household types together). SC households spend about 30% on cereals and "others" less than 25%. This variation is understandable given the knowledge of MPCE differences among rural household groups (see sub-paragraph 4.4.1).

4.6.7 We see from Statement 10U that proportion of urban expenditure on cereals is much lower (15%) than in rural areas (26%). Casual labour households, which we have seen (sub-paragraph 4.3.6) to be much worse off than other urban household types, spend proportionately much more on cereals, but only slightly more than other types on all food items together. The overall proportion of urban expenditure on food is, again, lower than the rural proportion (56% compared to 63% for rural). Household group variation (item 6) in expenditure on cereals is as might be expected, given the inter-group differences in MPCE (see sub-paragraph 4.3.5). Household group variation in the share of expenditure on all food items together is present but smaller than inter-group MPCE differences would lead us to expect.

4.6.8 Finally the break-up of MPCE into selected broad groups of expenditure items, which was presented for all-India in Statements 9R & 9U classified by household type and group, is shown state/unit-wise in Statement 11R and 11U separately for each type-group combination.

APPENDIX - I

LIST OF TABLES

table no.	description	page no.
1.	Estimated number of households and persons by sex for each socio-economic category of households : all - India	A1 - A8
2.	Per 1000 distribution of persons by monthly per capita expenditure class for each socio-economic category of households : all-India	A9 - A22
3.	Value (Rs.0.00) of consumption of broad groups of food items per person for a period of 30 days for each socio-economic category of households : all - India	A23 - A36
4.	Value (Rs. 0.00) of consumption of broad groups of non-food items per person for a period of 30 days for each socio-economic category of households : all - India	A37 - A41

EXPLANATION

CHART 50 T21

Chart 50 T21  
is a map of the area around the  
mouth of the Columbia River.

M - 12  
Chart 50 T21  
was made by the U.S. Army Corps of Engineers  
in 1860. It shows the Columbia River and  
its tributaries.

Sa - 12  
Chart 50 T21  
was made by the U.S. Army Corps of Engineers  
in 1860. It shows the Columbia River and  
its tributaries.

Scd - 12  
Chart 50 T21  
was made by the U.S. Army Corps of Engineers  
in 1860. It shows the Columbia River and  
its tributaries.

Tch - 12  
Chart 50 T21  
was made by the U.S. Army Corps of Engineers  
in 1860. It shows the Columbia River and  
its tributaries.
