LITERACY IN INDIA

NSS FORTY-SEVENTH ROUND

July - December 1991

**NATIONAL SAMPLE SURVEY ORGANISATION
DEPARTMENT OF STATISTICS
GOVERNMENT OF INDIA
NEW DELHI**

PREFACE

Literacy level of any population is one of the most important indicators of development of the country. The Government of India has been making strenuous efforts for achieving higher literacy levels through various special schemes like 'adult education', 'non-formal education', 'literacy mission', etc., besides, of course, the regular programmes of providing education to its masses. For implementation of any programme, a good statistical data base is most essential. Literacy data have been historically collected in the decennial Census of India. Although the NSSO has also collected data on some specific aspects of education in its quinquennial surveys on employment and in a few other socio-economic rounds, it was thought essential to supplement the existing information base by having nation-wide survey covering all facets of literacy. Therefore, an exclusive schedule on literacy and related aspects was included in the 47th round survey conducted during July- December 1991. A noteworthy feature of the survey was that a 'literacy test' was administered to a sub-sample of persons surveyed in order to verify their literacy status.

The present report, based on the above mentioned survey, comprises two chapters and two appendices. Chapter I consists of an introduction and a background note on the survey. Chapter II gives summary findings. Appendix A contains detailed tables at all-India level, while appendix B gives sample design and estimation procedure adopted in the survey.

The field work of the survey was done by the Field Operations Division; data processing and tabulation work were handled, as usual, by the Data Processing Division and the Survey Design and Research Division was responsible for preparing this report. I am thankful to the members of the Working Group particularly for taking pains to go through the draft report and offer their comments, which proved very helpful in improving the report. I am also thankful to the heads of various Divisions of the NSSO, who got the tasks assigned to their Divisions accomplished very efficiently.

New Delhi,
Dated : 20 October '95

(S.S. Srivastava)
Chief Executive Officer
National Sample Survey Organisation

REPORT NUMBER 394

LITERACY IN INDIA
(Based on 47th Round Survey : July-December 1991)

Contents

Description	Page No.
Chapter 1 : Introduction	1 - 5
Chapter 2 : Summary results -Part A	
Distribution of persons by age	6 - 10
Literacy rates	11 - 30
:Summary results -Part B	
Distribution by Gen. Education	31 - 36
Illiteracy	37 - 40
Literacy test	41 - 46
Knowledge of number system	46 - 50
:Summary results -Part C	
Reading habits of literates	51 - 54
:Summary results -Part D	
Literacy status of households	55 - 59
List of tables	60
Appendix A : Detailed all-India tables	A.1 - A.41
Appendix B : Sample design & estimation procedure	B.1 - B.5

CHAPTER 1

INTRODUCTION

1.1 Background of Survey: Literacy levels of the population constitute one of the most important determinants of the quality of population and literacy rate is generally accepted as one of the basic indicators of its progress. In underdeveloped countries literacy levels are generally low. In India these levels also exhibit wide variation by region, gender, social group, income group, etc. Efforts are being made to raise literacy levels through various schemes of universal school education, adult education, non-formal education, literacy mission campaigns etc. For the successful implementation of all these schemes a good statistical data base is essential. We also need to study the relation between different socio-economic variables, literacy and education. It is in this context that the National Sample Survey Organisation (NSSO) directed an inquiry in the 47th round of survey operations to the topic of literacy along with a survey on disability. A separate schedule was canvassed for ascertaining literacy status of persons. Also included were certain items regarding participation in cultural activities on which another report has been brought out.

1.2 Collection of literacy data: The NSS, since its inception in 1950 has been conducting socio-economic surveys on a variety of subjects. Data on literacy and educational levels of the population are being collected as part of the demographic particulars of the household members in many of the rounds. However, particular mention needs to be made of the quinquennial surveys on employment-unemployment. The data on literacy and educational levels collected through these surveys were subjected to detailed tabulation for various age-groups, social groups, religion etc. These surveys started from the 27th round (1972-73) with a roughly five years interval. The latest such survey results are available for the 43rd round (1987-88). Further, in the 47nd round (1986-86) a comprehensive survey on education was carried out by NSSO to study the extent of participation of children and youth in the formal and non-formal educational system including drop outs at various levels. The other sources of literacy and educational statistics in the country are (i) the Census of India (ii) statistics compiled by the Ministry of Human Resources Development, (iii) district literacy surveys of the 'Total Literacy Campaigns' of the National Literacy Mission and (iv) Surveys and Reports of National Council of Educational Research and Training. Of these the Census of India is the most important and widely used source. The Census results on number of literates (illiterates) and educational levels are available at disaggregated levels by sex, age, social groups etc. The literacy rates obtained from the census and NSS together provide a continuous series on the literacy situation prevailing in the country.

The census has to rely on more than a million essentially honorary enumerators. It cannot, therefore probe the responses. The NSS investigators, on the other hand, can be trained to probe the responses and can provide information to supplement the census data.

1.3 Special features of the present survey : The major departure of the present survey on literacy was in the definition of literacy and in the survey instruments used for this round, which included a test in assessing the literacy status of persons. For the surveys of NSSO before the present round, a literate person was defined as ' one who could read and write a simple message in any language '. The Census of India on the other hand had been using the definition as 'one who could read and write a simple message in any language with understanding', which was similar to the definition used by UNESCO and other agencies. Thus the definitions used by NSSO and the Census of India differed to some extent. In view of the above, the Working Group set up by the Governing Council of NSSO for the planning and design of the 47th round survey recommended that the definition of a literate used in the NSS should be identical to the Census definition for strict comparison of the estimates. Quite often the relevant information is not collected from the concerned persons but from proxy informant and the response of the informants has to be accepted. The Working Group further recommended that in a sub-sample of households a verification test for 'literacy' should be conducted for those who claimed to be literate but had less than five years of formal schooling, and whose age exceeded 14 years. The test was to be conducted with the aid of a set of simple passages in any one of the 31 languages of the country in which instruction at the primary level is imparted in various states/union territories. The respondents were required to read the passage and answer simple questions based on the passage to test their comprehension. Details of the test are discussed in Part B of chapter 2.

Besides, information was collected on persons who lapsed into illiteracy and level of their schooling, reading habits and knowledge of number system ie. certain aspects of 'numeracy' as opposed to 'literacy'. The last item included questions on knowledge in counting, reading, and writing of numbers and ability to perform simple arithmetic operations.

1.4 General Organisational aspects of the Survey : The main subjects covered in the 47th Round were 'disability among the people and 'literacy and culture'. Three other subjects on which separate schedules were canvassed in this round were (a)Developmental milestones of children (b) village facilities and (c) annual survey on consumer expenditure and employment and unemployment. The geographical coverage of the survey was the whole of India except (i) Ladakh and Kargil districts of Jammu & Kashmir (ii) 768 interior villages of Nagaland located beyond 5 kms. of any bus route and (iii) 172 villages of Andaman and

Nicobar Islands which are generally inaccessible throughout the year. However, though included in the original plan, some more districts of Jammu & Kashmir state also could not be covered due to disturbed conditions prevailing there during the survey period. The field work of the survey was carried out from July 1991 to December 1991.

1.5 Sample Design : A two stage stratified design with the first stage units as villages or urban blocks, as the case may be, and households as second stage units was adopted. The selection of villages was mostly based on the 1981 census list of villages. The selection of urban blocks was based on the Urban Frame Survey (UFS) blocks prepared by NSSO. For the survey on literacy & culture, the number of households canvassed in a village/block varied from 4 to 18, the actual number being determined on the basis of households available for the survey on 'disability'. One half of the households selected for literacy survey were further considered for the 'literacy test'. The details of the sample design and estimation procedure adopted are given in the technical appendix to this report. A total number of 4373 villages and 2503 urban blocks were surveyed. The number of villages/blocks originally allotted and actually surveyed in different states/union territories are given in Table(1.1). Actual number of persons surveyed was 182271 in rural sector and 122807 in urban sector. The break-up of the persons surveyed by state is given in Table(1.2).

1.6 Contents of this report : Chapter 2 of this report gives the summary of the survey findings. The broad findings of the survey are highlighted by presenting summary tables and notes. The detailed tables are presented in Appendix A followed by the detailed sample design and estimation procedure in Appendix B. While detailed appendix tables are given only for all-India, the results for states/uts are presented only in the form of summary tables in Chapter 2.

CHAPTER 2

SUMMARY RESULTS

2.0 In this chapter the main findings of the survey are presented. These findings are derived from the tables generated from the survey data. The detailed tables prepared as per the tabulation plan for this particular survey are given in the appendix A. In first part of chapter 2, the literacy rates for the states and all-India are discussed along with its relation with classificatory variables like age, social group, mpce, land possessed etc. In part B, certain new dimensions of literacy inquired into are discussed. These are literacy by mother tongue, general educational levels, literates who lapsed in to illiteracy, results of literacy test, knowledge of number system, reading habits etc. In Part C, results of a special tabulation on households without any literate member are presented. At the outset it is to be cautioned that results pertaining to North-Eastern states show relatively abnormal deviations from known sources of literacy information especially the Census of India. This is perhaps suggestive of some difficulties in the survey execution in these areas, apart from possible inadequacy of sample size for detailed tabulation of some results.

PART -A

2.1 Distribution of population by age : Age distribution of the population is very important for any study of literacy and educational attainments, as these variables are dependent on the age of persons. Based on the age recorded for each person surveyed, age distribution has been arrived at and is presented in table(2.1) for all the states/uts for rural and urban sectors for each sex. This distribution will also be helpful in combining or estimating rates for age groups which are not available from the tabulated results. It can be seen that while the distribution for males and females is rather close, there is a difference in the distribution between rural and urban sectors. A larger percentage of people in the rural area belongs to the younger age groups.

Table(2.1): Per 1000 distribution of persons by age-group

Note: The difference between sum of columns 2 to 9 and 1000 is due to rounding off of numbers.

2.2 Literacy rates : Literacy rate is the simple ratio of number of literate persons to the total number of persons in the population under consideration, a literate person being defined as one who can read and write a simple message with understanding. This is the most widely used indicator of literacy. The literacy rates obtained for the population aged 5 years and above during the past three quinquennial surveys and the current survey are presented in table(2.2.1).

Table (2.2.1) : Number of literates per 1000 persons aged 5 years and above

survey round (year)	all-India			
	rural		urban	
	male	female	male	female
(1)	(2)	(3)	(4)	(5)
47(July-Dec,91)	553	311	807	645
43(1987-88)	556	295	808	625
38(1983)	521	264	789	590
32(1977-78)	482	214	780	572

2.2.1 It is seen from the above table that according to the present survey the literacy level during the second half of 1991 was almost at the same level as obtained during the 1987-88 survey for males and about 2 percentage points higher for females. This contrasts with the increasing trend being observed in the previous survey results. A possible reason for this could be the rigorous implementation of the definition of literate person followed in the present survey.

2.2.2 As stated in the introductory remarks, one of the main features of the survey was the change in the definition which was given sufficient stress in the instructions to the field workers. The female literacy is likely to show a larger increase from its low base than male literacy which is comparatively higher. There is in fact some evidence to show that this lower figure is indeed due to the change in the definition. The NSS has been canvassing an annual survey on consumer expenditure from 2 households in the selected village/urban block. In this schedule also, the general educational level of each household member is collected. In the 47th round, this schedule was canvassed as usual with the definition of literacy as followed in the previous rounds. The

literacy rates obtained from the data collected from this independent set of households are given below. Schedule 1.0 was canvassed for consumer expenditure and Schedule 30 on literacy.

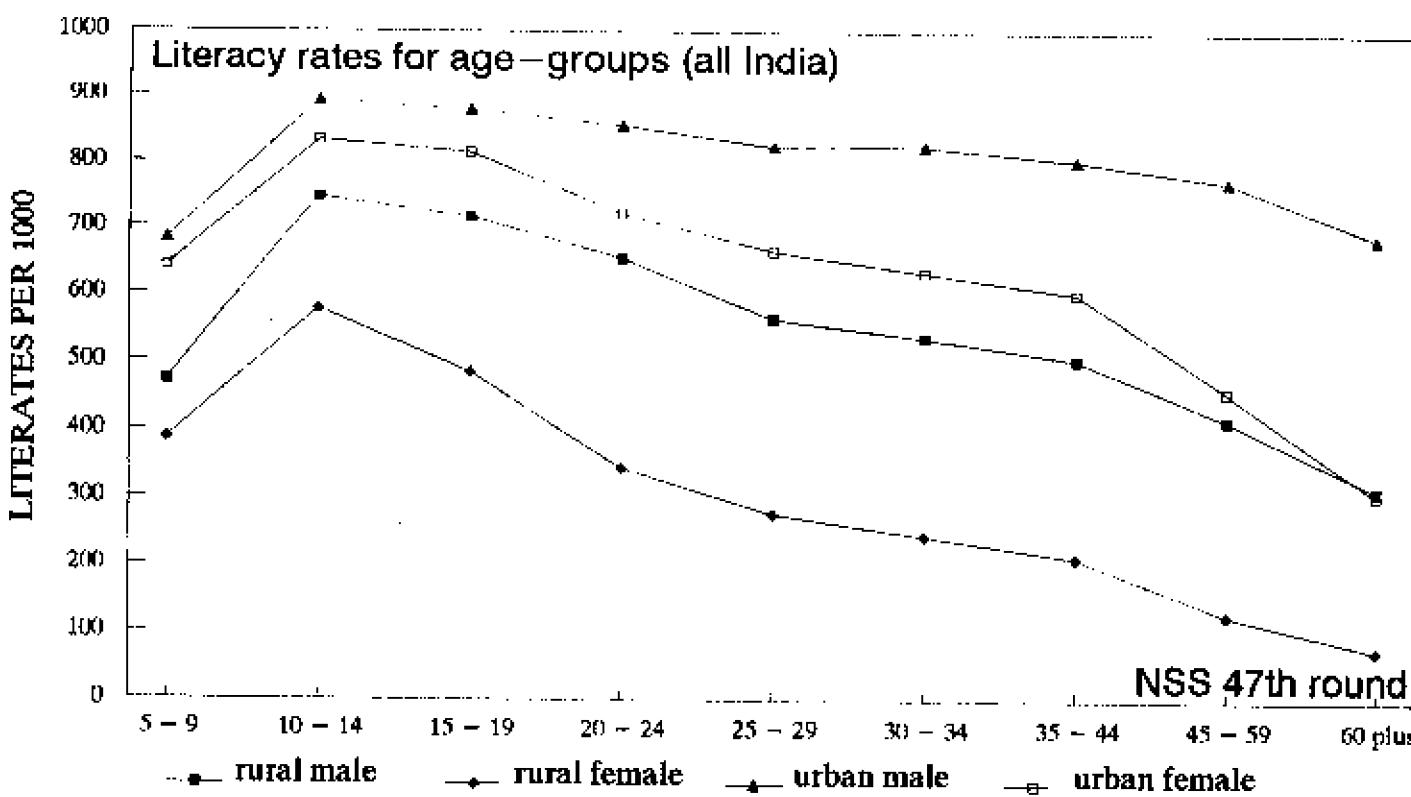

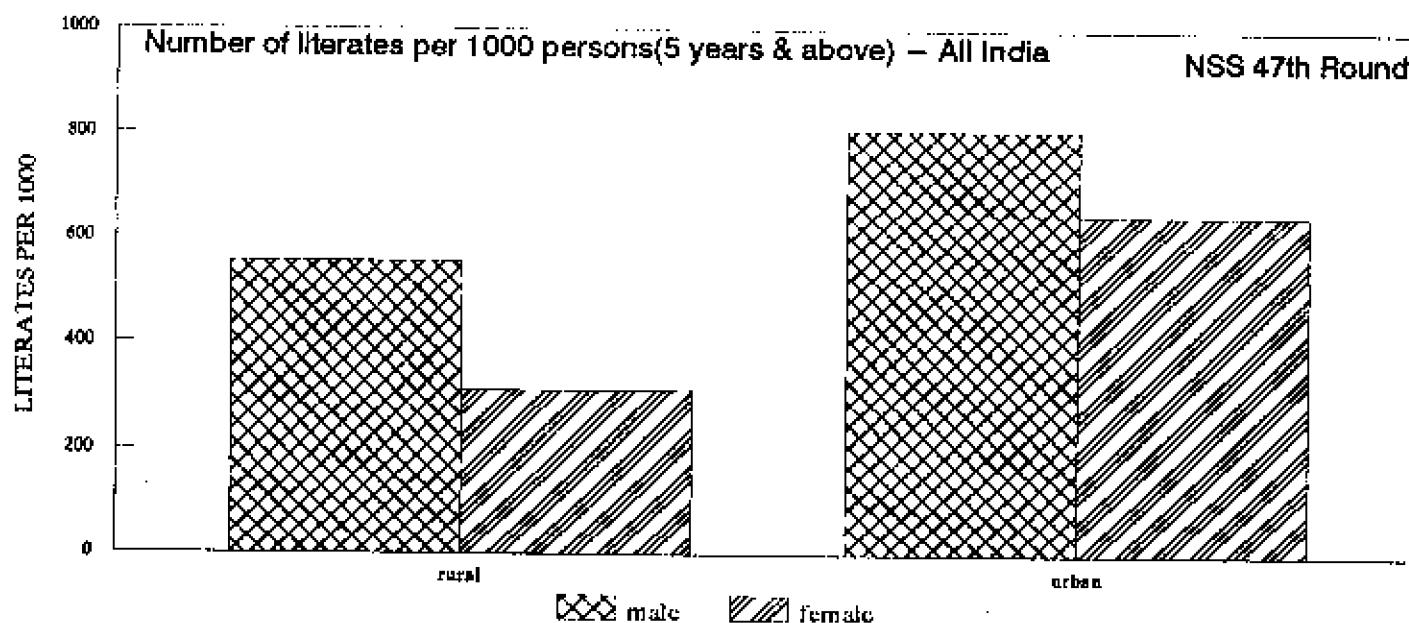

Table(2.2.2) : Number of literates per 1000 persons aged 5 years and above based on schedule 1.0 and 30.

all-India

schedule from which rate is derived	rural			urban			
	male	female	person	male	female	person	
(1)	(2)	(3)	(4)	(5)	(6)	(7)	
1.0	601	363	486	845	697	775	
30	553	311	436	807	645	731	

The ratios obtained from schedule 1.0 are uniformly higher than those based on schedule 30 and more or less follow the general increasing trend over time observed from the previous survey results[ref. table(2.2.1)]. Except for urban males, the rates differ by about 5 percentage points. In case of urban males, where the rates are quite high, the difference is of the order of about 4 percentage points. Apart from the fact that the sample size used for Schedule 1.0 is small compared to that in the present survey, the only explanation for this could be the definitional change introduced in the literacy survey.

2.2.3 The Census of India is another important source of literacy data in the country. The 1991 census was conducted with March 1, as the reference date. The 47th round survey was conducted during July 1991 to December 1991. Thus the reference periods for both these are very close. With a similar definition in both these sources, it is expected that the rates thrown up from these two would be very comparable. In the 1991 census, only persons of age 7 years and above were considered for estimating literacy rates. In the NSS, though persons age 5 years and above were considered, for comparison purposes with the census, literacy rates for persons with age 7 years and above were computed. These are given in table (2.2.3).

Table(2.2.3) : Number of literates per 1000 persons of age 7 years and above in the census 1991 and NSS 47th round

source	all-India					
	rural			urban		
	male	female	person	male	female	person
(1)	(2)	(3)	(4)	(5)	(6)	(7)
census, 1991	579	306	447	811	641	731
NSS, 47th round	570	315	446	822	653	742

Source: Table 6, Paper 2 of 1992, Series 1 of Census 1991 (excludes Jammu & Kashmir)

Considering that the rates have been estimated from two independent sources totally different methods, the all-India level rates are remarkably close. They are also close for most of the States as can be seen from the discussion in para 2.3 .

2.2.4 Age specific literacy rates : Literacy rates for specific age groups are very helpful in understanding the spread of literacy among the population. It is also important in the context of plans for attaining a total literacy among the population. With the spread of school attendance, literacy among the school going age group will be higher than the rates for the other age groups. Literacy being an ability, as the population moves to a higher age group, ,the rate is expected to be maintained but for those who lapse into illiteracy and other social and demographic changes in the population. Thus the results of two surveys with an interval should be consistent for the corresponding age groups with the same interval between them. Though age specific rates are available from the earlier surveys, due to the change in the definition in the current round such a comparison may not be meaningful and hence no such comparison has been attempted in this report. The age specific literacy rates for all-India are presented in table(2.2.4).

Table(2.2.4) Number of literate persons per 1000 persons for each age group.

all-India

age-group (years)	rural			urban			all-India
	male	female	person	male	female	person	
(1)	(2)	(3)	(4)	(5)	(6)	(7)	
5-9	472	387	432	682	640	662	
10-14	746	577	669	893	833	865	
15-19	715	484	610	878	814	849	
20-24	653	344	492	855	721	792	
25-29	563	277	419	824	664	745	
30-34	536	245	388	825	633	735	
35-44	504	213	365	801	602	710	
45-59	418	127	273	772	458	628	
60 & above	314	76	198	685	306	494	
5 & above	553	311	436	807	645	731	
5-14	604	475	544	786	734	761	
15 & above	532	252	395	813	615	720	

The table(2.2.4) reveals that the literacy rate is the highest for the age group 10-14 and lowest for the 60 & above group. For the school going age group (i.e. 5-14) the literacy rates are 604 and 475 per 1000 rural males and females respectively. The male-female difference is seen to be much higher in rural areas than in urban areas. Further, at the all-India level, the literacy rates for the 5-14 years group are higher than those for 15 years and above group (i.e., those who are generally out of the schooling system) except in the case of urban males. Thus while 81.3 per cent of the urban males in the 15 and above age group are found to be literate, the corresponding literacy rate for the 5-14 age group is only 78.6 per cent.

2.3 Literacy rates for states : As is seen from the all-India level estimates of literacy rates, there is a wide gap in the literacy levels between urban and rural areas and between males and females. Further, different states in the country have widely differing levels of literacy. Kerala, for example is known to have achieved near complete literacy among the population. Achievement of literacy in various States and Union Territories is shown in Table(2.3.1). The literacy rates are presented for three different base populations: (a) 5 years and above, (b) 7 years and above and (c) 15 years and above.

2.3.1 In rural areas, the scenario in the states is extremely uneven. Among the male population of age 5 years and above, the literacy rate is highest for Kerala(87.9%) followed by Mizoram(83.9%) and Goa(80.3%). All other states have below 80 per cent literacy. The lowest male literacy is in Arunachal Pradesh(40.7%). The other states/uts. with below 50 per cent literacy among males in the rural sector are Andhra Pradesh(43.1%), Rajasthan(46.1%), Bihar(46.6%), Dadra & Nagar Haveli(48.4%) and Madhya Pradesh(48.8%).

2.3.2 The female literacy in rural areas is very low for most of the major states. For Rajasthan, which has the lowest rate, it is a mere 13.6 per cent for the population aged 5 years and above. States recording below 25 per cent literacy rates among rural females are Bihar(20.2%), Madhya Pradesh(20.3%), Uttar Pradesh(21.8%), Andhra Pradesh(22.8%) and Arunachal Pradesh(23.9%). The all-India rate is seen to be 31.1 per cent. The highest literacy rate among females is in Kerala(82.4%) followed by Mizoram(78.9%).

2.3.3 The literacy rates in urban areas are substantially higher than those in the rural sector. The ranking of the states/uts. by literacy rates is different in the urban sector in comparison to rural sector. However, the size and percentage of urban population in total population in each state differ very much. For example, according to the 1991 census, in Himachal Pradesh only about 4.5 lakh persons, or about 8.7 per cent of the population, reside in urban areas, while in Maharashtra, 38.7 per cent of its population amounting to about 305 lakh persons reside in the urban sector.

2.3.4 In Table(2.3.2), the literacy rates are presented for certain specified age groups to help study the rate differentials among different cohorts of population.

2.3.5 Combining the rural-urban rates for males, females and persons separately, the states/uts are arranged in the descending order of literacy rates in table(2.3.3). Among the states it can be seen that Andhra Pradesh, Arunachal Pradesh, Bihar, Jammu & Kashmir, Karnataka, Rajasthan, Madhya Pradesh, Orissa and Uttar Pradesh are below the country as a whole in overall literacy.

2.4 The literacy rates obtained for the states/uts. are compared with the rates derived from the 1991 census in Table(2.4). There is a close agreement between the two rates for most of the states/uts. However, for states in the North Eastern region the two sets of figures differ considerably. In the case of Arunachal Pradesh the difference is of the order of 16 percentage points while in the case of Assam it is around 10 percentage points.

Delhi	75.29	75.50
Lakshadweep	81.78	70.90
Pondicherry	74.74	67.80
All-India	52.21	51.90

* Note : The 1991 census was not conducted in Jammu & Kashmir. However, in the NSS 47th round all-India estimate includes Jammu & Kashmir except for the districts of Jhelum valley which could not be surveyed.

2 5 literacy rates for social groups For any study on disparity among population, an important variable for classifying the population is the social group to which a person belongs In the NSS, the head of the household surveyed is identified as belonging to one of the following social groups - (i) Scheduled Tribes (ii) Scheduled Castes and (iii) Others Each Member of the household is assigned the social group of the head of the household Literacy rates were separately tabulated for these groups These are presented in table(2 5 1)

Table(2 5 1) Number of literates per 1000 persons for each social group

age group	all-India					
	scheduled tribe		scheduled caste		others	
	male	female	male	female	male	female
(1)	(2)	(3)	(4)	(5)	(6)	(7)
rural						
5 & above	381	170	448	211	608	360
7 & above	393	169	460	211	626	364
15 & above	341	116	413	136	593	304
urban						
5 & above	653	467	679	450	832	682
7 & above	666	468	697	451	846	691
15 & above	652	429	664	368	841	658

In the rural sector the literacy rates are lowest for scheduled tribes followed by scheduled castes, while in the urban sector scheduled tribe females have reported higher literacy levels than scheduled castes In table(2 5 2) the literacy rates for population aged 5 years and above are presented for various states/uts The results are presented only where the sample persons under a category are 20 or more It is to be noted that in the NSS the social group of only the head of the household is recorded and the same is assigned as the household social group No verification is attempted to check whether the caste/tribe is among the castes/tribes put under the "scheduled" category In the census operations, scheduled caste/tribe status is assigned to persons only if the caste/tribe of the person is among the caste/tribe "scheduled" for that particular state/ut Thus, in NSS it is possible that same persons will be classified as scheduled caste/tribe persons even if their caste/tribe has not been "scheduled" for that particular state

2.6 Literacy rates for MPCE classes Monthly Per Capita Expenditure data are collected as a proxy for income data. The data tabulated at all-India level given in table(2.6) confirm the fact that the literacy rates for persons in the higher expenditure classes are much higher in comparison to those of persons in the lower expenditure classes. Admittedly, the MPCE data was ascertained from the household by a single direct question unlike in the consumer expenditure surveys and as such the MPCE distribution is subject to reporting biases. About 73 per cent of persons in the expenditure class Rs 385 and above per month are literate, while the literacy rate for the bottom group viz less than Rs 65 per month is only 27 per cent in the rural areas. In the urban sector, the rates are 95 percent and 52 percent for expenditure classes Rs 700 & above and less than Rs 90, respectively.

Table(2.6) Number of literate persons per 1000 persons of age 5 years and above

all-India

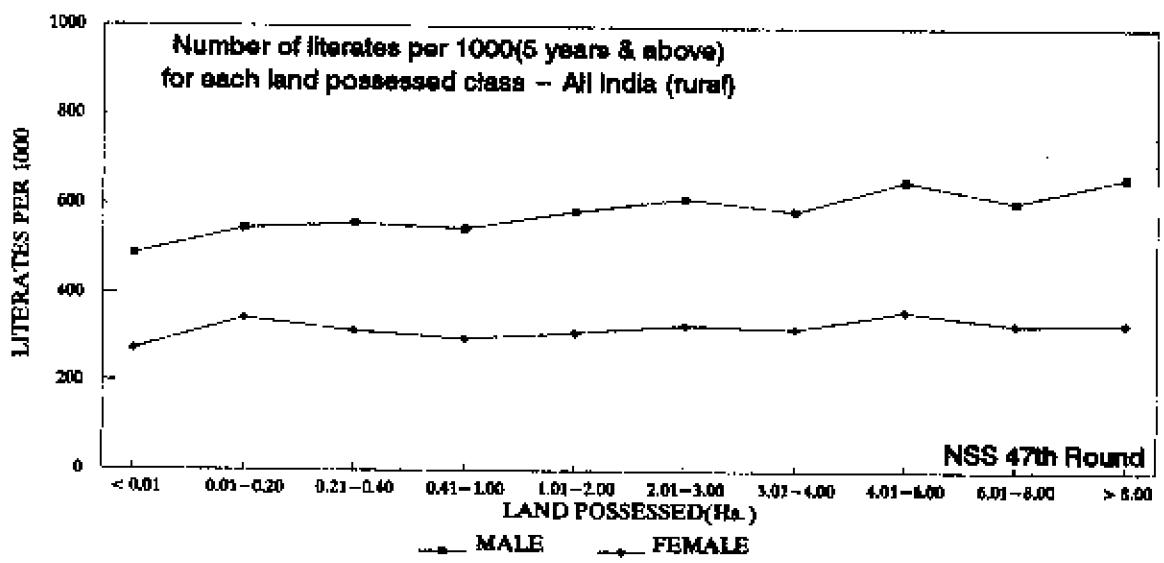

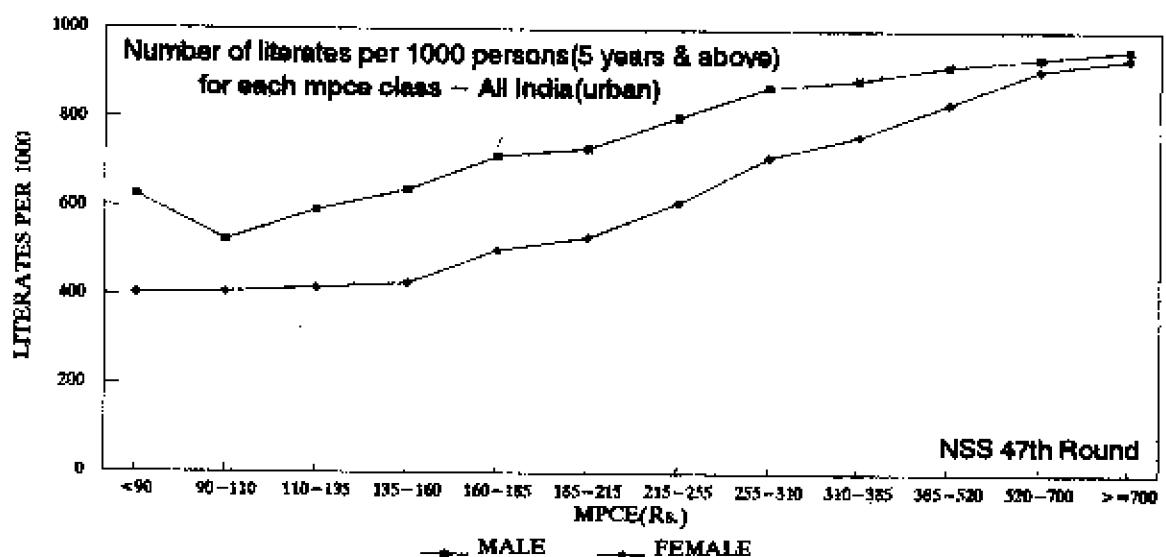

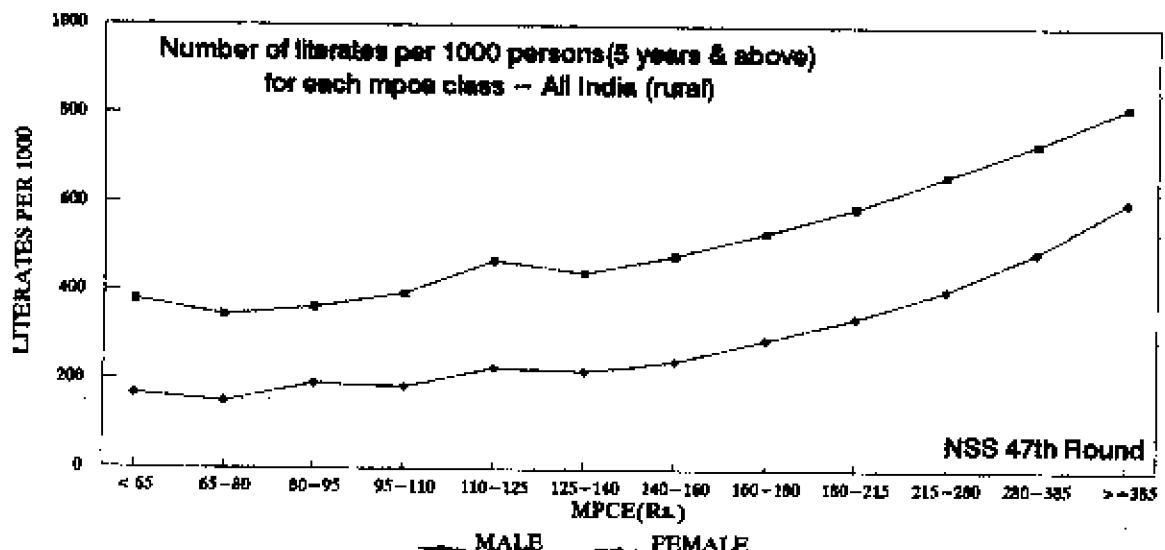

mpce class (Rs)	male (1)	female (2)	person (3)	all-India (4)

310 - 385	890	763	832	
385 - 520	923	838	885	
520 - 700	940	915	929	
700 & above	959	941	951	
all	807	645	731	

It can be noticed that the literacy rate declines by 54 per cent from the highest MPCE class to the lowest for males and by 72 per cent for females in the rural sector. In the urban sector, the corresponding decrease is 35 per cent and 57 per cent, respectively. The literacy levels fall faster for the females as we move from the higher expenditure class to the lower expenditure class.

2.7 Literacy and land possessed : In rural sector, the amount of land possessed by the household is another proxy variable for the economic well being of the people though not as powerful as the MPCE. The relevant results are given in table(2.7). Interestingly, the literacy rate declines by 27 per cent from the highest land class to the lowest class for males whereas the decrease is only of the order of 19 per cent for females. As land is not a homogeneous asset as a proxy for wealth its association may not be as strong with literacy as with MPCE.

Table(2.7) : Number of literate persons per 1000 persons of age 5 years and above for each land possessed class
all-India rural

SUMMARY RESULTS - PART B

2.8 Distribution of literates by general education : Education is the basic instrument through which literacy is achieved. While primary level education may be adequate to achieve the basic ability to read and write, higher levels of education help persons to develop their skills and understanding. An analysis of the levels of education achieved by the persons is essential to understand the overall quality of the literate population. As literacy can be achieved through formal as well as non-formal schooling, an effort was made to study the proportion of persons achieving literacy through non-formal education, by inclusion of separate codes for literate without formal schooling. These were in three categories viz. literate through (i) attending Non-Formal Education Centres (NFEC) (ii) attending Adult Education Centres (AEC) and (iii) other means. Percentage of literates who have achieved literacy through any of the above means among the literate persons are given in table(2.8.1). Only one per cent of the literates in rural sector had attained literacy through non-formal channels (ie. other than regular schooling), whereas in urban sector only half a per cent of the literates reported use of non-formal channels. One possible reason for the low estimates of the number of persons acquiring literacy through non-formal channels could be that, while identifying such persons, those who had some formal schooling in the past were assigned the formal schooling codes rather than the non-formal codes

Table (2.8.1) : Percentage of literates without formal schooling among literates of age 15 years and above

all-India

literate through attending	rural		urban	
	male	female	male	female
(1)	(2)	(3)	(4)	(5)
N F E C	0.2	0.2	0.1	0.1
A E C	0.2	0.2	0.1	0.1
Other means	0.6	0.6	0.3	0.3

2.8.1 The distribution of literates by various general education categories is given in table(2.8.2). The levels indicated in the table relate to the level successfully completed by the person. A large proportion of females belongs to the lower educational levels when compared to their male counterparts both in rural and urban sectors. In fact, slightly above 68 per cent of the literate females have completed only primary or below primary level of education in the rural sector,while this percentage is around 47 in urban sector. This is in contrast to about 58 and 40 per cent for males in the respective sectors.

Table(2.8.2) : Per 1000 distribution of literate(5 years & above) by general education

all-India

general education	rural			urban		
	male	female	person	male	female	person
below primary*	289	334	304	183	204	192
primary	291	348	310	215	270	238
middle	227	202	218	220	221	220
secondary	111	77	99	162	149	157
higher secondary	51	28	43	94	74	86
graduate & above	32	11	25	125	82	107
all	1000	1000	1000	1000	1000	1000

* includes those without formal schooling also

However, in comparison to the 43rd round survey(1987-88) it is seen that there is an improvement in the distribution, in the sense that the percentage share of persons with higher levels of education has increased by the use of the current survey. Since only very few of those aged less than 5 years are expected to be literate , the comparison of 43rd and 47th round results are presented in table(2.8.3), ignoring the fact that the distribution for 43rd round is based on literates of all ages and that for 47th is only for persons of age 5 years and above.

2.8.2 The distribution of literates by general education for states/uts. is given in table(2.8.4). States/uts recording high overall literacy have higher percentages of literates with higher educational levels than states recording low literacy rates. The education below primary level includes persons who have not completed primary level of schooling and also persons becoming literate through non-formal schooling. The latter category at all-India level has been seen to be very small. But, in a few North Eastern states this category was recorded as quite high in the rural sector. These were Manipur(8.4%), Nagaland(16.8%), Arunachal Pradesh(6.4%).

2.9 Illiterates and their past literacy status and schooling:
 Literacy status being based on a dichotomous classification, literates and illiterates are complementary at any point of time. By considering the past statuses of illiterates, it is possible to see whether some of the currently illiterates were literates in the past and had not retained the literacy status. This literacy retention is an important component in planning for literacy programs. In the 47th round, persons reported as not literate were asked if (i) they were ever literate, (ii) if they had completed 4 years of formal schooling and (iii) if they had completed NFEC/AEC course. The results based on these responses are given in table(2.9.1)

Table (2.9.1) : Number of literates who had relapsed into illiteracy per 1000 illiterates

age-group							all-India
	rural			urban			
	male	female	person	male	female	person	
(1)	(2)	(3)	(4)	(5)	(6)	(7)	
5 & above	21	12	16	32	19	24	
15 & above	22	11	15	30	18	22	
Distrn. of persons who had relapsed into illiteracy (5 years and above)	546	454	1000	508	492	1000	

Table(2.9.1) gives the number of illiterates who were reported as having been literate per 1000 illiterates for male, female and combined. The last row gives the male-female distribution of 1000 illiterate persons who were ever literate. For the population covered in the survey(i.e. 5 years and above) out of 1000 rural illiterate males only 21 had relapsed into illiteracy. The corresponding proportion for females was 12 only. In urban sector, these proportions were higher, while it was 32 for male it was 19 for female. In urban sector the persons who lapsed in to illiteracy were evenly distributed between males and females, and, in rural sector 545 out of 1000 literates who lapsed into illiteracy were males. Thus, the proportion of illiterate persons who were ever literates was higher among males than females and further higher in urban areas than in rural areas. However, the

same pattern did not necessarily obtain in all the states/uts. [table(2.9.2) cols(2) & (3)]. As the literacy levels go up and the facilities for basic education expand, it is possible that among the illiterates there will be more who had at one time been literate. The following table (table 2.9.3) gives the proportion of illiterates who had completed 4 years of formal schooling or completed Adult Education/Non-Formal Education Courses.

Table(2.9.3) : Number of illiterates who had completed 4 years formal schooling/AEC,NFEC course per 1000 illiterates

age-group (years)	no. of illiterates who completed 4 years of formal schooling			no. of illiterates who completed AEC/ NFEC Course			all-India
	male	female	person	male	female	person	
	(1)	(2)	(3)	(4)	(5)	(6)	(7)
rural							
5 & above	6	3	4		3	2	2
15 & above	5	3	4		3	2	2
per 1000 dist.	556	444	1000		463	537	1000
urban							
5 & above	10	6	8		5	3	3
15 & above	12	6	8		4	2	3
per 1000 dist.	511	489	1000		517	483	1000

These proportions are very small and at the all-India level they are consistent with the proportion of literates who had relapsed into illiteracy.

Table (2.9.2) : Number of (i) literates who lapsed into illiteracy (ii) Illiterates who completed 4 years of formal schooling and (iii) illiterates who completed AEC/NFEC per 1000 illiterates of age 5 years and above

2.10 Test for literacy : The procedure followed for the literacy test and the possibility of adjusting the literacy rates obtained from the data recorded through the informant's reports have been briefly mentioned in the introduction. The Working Group(W.G.) set up by the NSSO Governing Council(G.C.) had after careful deliberations recommended that as the informant's version may not always be true, a test for literacy may be undertaken in a sub-sample of the households. The W.G felt that the test may be restricted to persons aged 15 years and above who are reported as literates by the informants, but had received less than 5 years of schooling i.e., those categorised under the educational categories 'literate but with the level of education 'below primary'. Those with 5 or more years of education were to be accepted as literates, if they reported so, without any test. The test was carried-out only for those claiming literacy in the scheduled languages, English and another 15 specified languages in which instruction at primary level is imparted in various states/u.ts. These languages are:

Assamese	Sanskrit	Manipuri
Bengali	Sindhi	Santhali
Gujarati	Tamil	Tulu
Hindi	Telugu	Gondi
Kannada	Urdu	Khasi
Kashmiri	English	Garo
Malayalam	Bhilli	Oraon
Marathi	Dogri	Munadari
Oriya	Nepali	Tripuri
Punjabi	Konkani	Mizo

Simple passages relating to environment and everyday events were selected along with a set of simple questions for testing comprehension. For conducting the test on the basis of the informant's report, eligible persons were first contacted to verify the claim. The test was to be carried out only for those who themselves also claimed to be literate. The following instructions were given to the investigators on the actual conduct of the literacy test.

"For the purpose of conduct of the test, certain passages alongwith simple questions have been formulated and these are presented in as many as 30 languages in the booklet. The option to have a test in a particular language should be given to the individual member. Having chosen the language in which the test is to be administered, the Investigator should choose a passage suitable from the point of view of individual member's age, sex, general status and background. The individual member may be shown the passage and requested to read the same. Adequate time may be given to the individual member to read the passage. One or two questions may have to be asked to judge the member's comprehension, i.e. understanding of the passage read. The questions listed below the relevant passage may be consulted for the purpose. Having asked the question, if need be, the booklet may be given to the member being tested, to facilitate answering the questions. As regards 'writing ability' of the literacy test, the member may be asked to write a simple message.

Alternatively, the investigator may, slowly read one or two simple sentences from any of the passages. No specific provision has been made in the literacy test format for recording the writing of the individual members. A separate sheet for individual household may be used for administering the writing test. Identification particulars of the household in brief and that of the individual member(s) tested may be attached to the literacy format. If more than one member is required to be tested from the same household, it would be desirable to choose different passages for conducting the literacy tests." (Instructions to field staff, Vol III)

A typical test passage ran as follows- "A child's food is mother's milk. It must get enough of mother's milk. This is possible only when the mother gets sufficient and good food. Her diet should consist of cereals, pulses, green vegetables, fruits and milk." The suggested questions were:

1. " What is the best food for small child ? "
2. " What things should be there in mother's diet ? "

2.10.1 Persons identified as eligible for literacy test were individually contacted, by the investigator. They comprised of three groups : (i) those who could not be contacted, (ii) those declaring themselves as illiterate on individual contact and (iii) those claiming to be literate. All the persons required to be tested as per the procedure (i.e. those in Group (iii) who claimed to be literate) could not be tested in the fields for various reasons. These reasons were tabulated as: (a) Language of test not known by individual, (b) Language of test not known by the Investigator, (c) Refusal by the individual to take the test, (d) Individual could not be contacted for the test and (e) Other reasons.

2.10.2 Informants' and individuals' version : As a first step in the verification of literacy status, the investigator tried to contact the individual to ascertain the literacy status from him. The position obtaining on this basis is given in table (2.10.1). The figures quoted are the sample numbers only for the persons in the age-group 15 years and above coming under the group identified for literacy test

Out of a total of 5433 persons reported to be literate by the informants, at the all-India level only 3556 (66 per cent) were found literate as per the individual. Of the remainder, 1364 (i.e. 25 per cent) could not be individually contacted and thereby no test could be conducted for them. This in a way is a reflection of the field conditions which make it impossible to contact all the individuals inspite of specific efforts. The rest 513 (i.e. 9 per cent) declared themselves to be illiterate.

Table (2.10.1) : Status of persons aged 15 and above with less than five years of schooling and reported as literate by informants, who were contacted individually

sector	sex	no. reported as literate by informant	individual's claim when contacted		not con- tacted	all-India
			literate	not lit- erate		(6)
(1)	(2)	(3)	(4)	(5)		
rural	male	2444	1688	228	528	
	female	1330	857	123	350	
	person	3774	2545	351	878	
urban	male	965	573	96	296	
	female	694	438	66	190	
	person	1659	1011	162	486	

2.10.3 Persons tested and reasons for not testing : From among those reported to be literate, only 3125 could actually be tested for reasons cited earlier. The breakup of persons not tested by reasons is given in table (2.10.2). The most important reason for non-testing was inability to contact persons.

2.10.4 Outcome of test : The persons were separately tested for reading ability and writing ability. The concept of 'understanding' underlying the term literacy the comprehension of the text read was tested on the basis of the simple questions on the passage .The results of the reading test had three possible outcomes.

- (i) the person could read with comprehension.
- (ii) the person could read without comprehension.
- (iii) the person could not read.

The writing test resulted in only two possible outcomes viz. could write or could not write.

The number of persons who took the test and the outcome of the test are given in table(2.10.3). If a literate person is defined as one who could read with comprehension and also write, 2234 or 71 per cent (1631 in rural and 603 in urban) out of a total of 3129 could be treated as literate. The percentage of such persons was a little lower in urban areas (69 per cent) than in rural areas (72 per cent).

Table (2.10.2) : Number of persons tested and not tested by reasons for not testing

all-India

sex	total eligible for test	indiv- idual	could not be tested due to language of refusal known by	not cont- acted	oth- ers	total	number tested	
(1)	(2)	(3)	(4)	(5)	(6)	(7)	(8)	(9)
rural

person	875	687	131	57	695	180	603		

2.10.5 Adjustment factor: The literacy verification test was applied to persons who reported as literates in the age group 15 years and above. This group was split into two sub-groups viz. those who were literate with education level primary and above (PA) and those who were literate with less than primary level education (PB). The first sub-group was considered as having passed the test. On a sample of second sub-group, the test was administered. After contacting persons in the sub-group PB, those individuals who claimed to be illiterates were taken as failed in the test without any test. The remaining, i.e. those who on individual contact, reported as literate were subjected to the test. Thus, PB could be corrected on the basis of the test experience. Infact the test results show that in this group a large proportion of persons were found illiterate either on the basis of the actual test or on individually contacting the concerned persons . An adjustment factor was obtained after PB was reduced by the proportion of persons successful in the test(CF). CF was obtained as the ratio of the number of those confirmed literate by the test to the number of persons tested (i.e those declared illiterate plus those actually tested). This proportion viz. CF is given in table (2.10.4) for all-India. These proportions are rather low and indicate the presence of a sizable number of illiterates among this group who are otherwise reported as literate. However, since the number (PB) in the total number of literates is not substantial, it does not bring down the overall literacy rates as can be seen from the adjustment factors presented in table(2.10.5). The adjustment factor was worked out as = $(PA + PB*CF)/(PA + PB)$.

Table (2.10.4) : Proportion of persons found literate among persons tested

sector	all-India		
	male	female	persons
(1)	(2)	(3)	(4)
rural	0.637	0.604	0.626
urban	0.600	0.557	0.581

Table (2.10.5): Adjustment factors obtained on the basis of test

age-group	all-India					
	rural			urban		
	male	female	person	male	female	person
(1)	(2)	(3)	(4)	(5)	(6)	(7)
15 - 19	0.962	0.950	0.958	0.996	0.965	0.975
20 - 24	0.967	0.950	0.962	0.981	0.976	0.979
25 - 29	0.952	0.935	0.945	0.972	0.966	0.968
30 - 34	0.948	0.934	0.943	0.974	0.968	0.971
35 - 44	0.929	0.931	0.929	0.966	0.963	0.964
45 - 49	0.915	0.912	0.914	0.969	0.961	0.966
50 & above	0.888	0.875	0.880	0.948	0.930	0.942
15 & above	0.943	0.940	0.942	0.971	0.966	0.969

The above adjustment factor can be applied to the literacy rates presented in table(2.3.1) to arrive at the adjusted literacy rates. The adjustment factors estimated for major states are given in table(2.10.6).

Table(2.10.6) : The adjustment factors for literacy rates for persons of age 15 years and above

state	rural

2.11 Knowledge of number system : Ability to read and write a simple message with understanding is construed as literacy. Another related aspect as relevant as literacy in the social and economic context is the ability in dealing with numbers or arithmetical ability. The capability to perform simple calculations is generally considered vital part of 'functional literacy'. This ability is sometimes termed in the literature as 'numeracy' or 'arithmetical literacy'. Dr. Gunnar Myrdal in his work on South Asian countries had noted that 'the ability not only to read and write figures with understanding but also to add, subtract, multiply and divide is of importance in all industrial work, in rationally managed agriculture, in commercial and credit transactions and of course in such specific developmental efforts as planning at the local level and building up a network of cooperatives'. Unlike in the measurement of literacy no clear definition exists for measuring this ability. In the 47th Round certain questions relating to knowledge of number systems were asked. These were knowledge of (i) counting of numbers, (ii) reading of numbers, (iii) writing of numbers and (iv) simple arithmetic operations. Responses to questions (i) to (iii) were grouped into four categories viz. (1) cannot count/read/write, (2) can count/read/write upto 10 (3) can count/read/write upto 100 and (4) can count/read/write upto any

number. Knowledge of arithmetic operations was graded into (1) none, (2) addition only, (3) addition and subtraction only, (4) addition and multiplication only (5) addition, subtraction and multiplication only, (6) addition, subtraction, multiplication and division. Although the knowledge of number system is more amenable to verification through objective tests, was not tried out in the present survey. As this was the first attempt of its kind, it is not possible to make any statement about the conceptual errors likely to be present in the actual data collection.

2.11.1 Proportion of persons with no numerical ability : Before the results on the four kinds of ability studied in the survey are analysed the proportion of persons with no ability to count/read/write numbers or perform arithmetic operations obtaining from the study are presented below in table (2.11.1).

Table (2.11.1) : Number of persons per 1000 persons who cannot count/read/write numbers or perform arithmetic operations in the population of age 15 years and above

		all-India			
sector	sex	cannot			
		count numbers	read numbers	write numbers	perform arithmetic operations
(1)	(2)	(3)	(4)	(5)	(6)
rural	male	102	378	400	195
	female	267	657	677	416
urban	male	41	132	143	70
	female	129	307	322	194

For columns 3, 4 and 5 inability to count, read and write numbers upto 10 were considered. For column 6 persons who cannot perform even simple addition are considered, without specific range of numbers and therefore perhaps these proportions were lower than those in column 4 & 5. The proportions in columns 4 and 5 i.e. those who cannot read or write numbers even upto ten are consistent with the proportions of illiterate for the same age group. These are 468, 748, 187 and 385 for rural male, rural female, urban male and urban female respectively. More detailed results on the four abilities in dealing with numbers are presented in the following four tables. The difficulties of collecting this information from the informants for each of the household members have to be kept in mind in judging these results. As these results are exploratory in nature, separate results for various states are not presented.

2.11.2 Counting of numbers : Table (2.11.2) gives the distribution of persons by their knowledge of counting of numbers. One may consider the age group 15 and above as consisting of persons for whom the knowledge of counting is more valuable as they constitute the economically active segment.

Table (2.11.2) : Per 1000 distribution of persons by knowledge of counting of numbers

all-India

age-group (years)	knowledge of counting					all including not recorded cases (any number)	
	can not count		can count				
	upto 10	upto 100	others				
(1)	(2)	(3)	(4)	(5)	(6)		
<u>rural male</u>							
15 & above	102	116	229	546	1000		
7 & above	109	123	233	528	1000		
5 & above	131	132	230	500	1000		
<u>rural female</u>							
15 & above	267	230	214	277	1000		
7 & above	254	221	216	297	1000		
5 & above	268	224	212	284	1000		
<u>urban male</u>							
15 & above	41	35	101	817	1000		
7 & above	42	44	126	783	1000		
5 & above	52	54	135	752	1000		
<u>urban female</u>							
15 & above	129	101	146	614	1000		
7 & above	118	100	160	612	1000		
5 & above	126	108	167	588	1000		

Among the rural males just about 10 percent have been reported as unable to count even upto ten. Among the urban males this is about 4 percent. Among the females about 27 and 13 percent in rural and urban areas have been recorded as unable to count'. At the other extreme,about 55 percent of rural males had no difficulty whatsoever in counting beyond 100 while the figure was only 28 percent for rural females. In the urban sector, corresponding figures were 82 percent and about 61 percent for males and females respectively. The appendix tables give the distribution for different age groups. Generally the knowledge of counting was the least in the 5-9 and 60 & above group and highest in the 15-19 age group.

2.11.3 Reading and writing of numbers : Reading and decoding of numbers is an ability closely relating to reading of alphabets. The percentage of people who cannot read or write any number was close to the percentage of people who are illiterate. The results on ability to read numbers are presented in table (2.11.3) and those on ability to write of numbers are shown in table (2.11.4).

Table (2.11.3) : Per 1000 distribution of persons by ability to read numbers

all-India

age-group (years)	ability to read numbers				all including not recorded cases (any number)	
	can not read		can read			
	upto 10	upto 100	others			
(1)	(2)	(3)	(4)	(5)	(6)	
			<u>rural male</u>			
15 & above	378	50	92	474	1000

			<u>rural female</u>			
15 & above	657	52	57	222	1000	
7 & above	599	59	81	250	1000	
5 & above	603	65	82	238	1000	
			<u>urban male</u>			
15 & above	132	24	56	781	1000	
7 & above	125	33	85	751	1000	
5 & above	137	41	94	721	1000	
			<u>urban female</u>			
15 & above	307	41	70	573	1000	
7 & above	274	47	94	576	1000	
5 & above	279	54	103	553	1000	

Table (2.11.4) : Per 1000 distribution of persons by ability to write numbers

all-India

age-group (years)	ability to write numbers				all including not recorded cases (any number)	
	can not write		can write			
	upto 10	upto 100	others			
(1)	(2)	(3)	(4)	(5)	(6)	
			<u>rural male</u>			
15 & above	400	43	83	467	1000	
7 & above	368	52	111	461	1000	
5 & above	335	59	112	437	1000	
			<u>rural female</u>			
15 & above	677	41	50	219	1000	
7 & above	617	50	75	246	1000	
5 & above	621	56	76	235	1000	
			<u>urban male</u>			
15 & above	143	21	53	776	1000	
7 & above	135	31	82	746	1000	
5 & above	147	39	92	716	1000	
			<u>urban female</u>			
15 & above	322	35	66	567	1000	
7 & above	287	42	91	571	1000	
5 & above	293	49	99	549	1000	

2.11.4 Knowledge of arithmetic operations : The distribution of persons by knowledge of arithmetic operations is given in table (2.11.5). It may be noted that unlike in the previous tables no limits were specified here to measure the ability for arithmetic operations.

Table (2.11.5) : Per 1000 distribution of persons by knowledge of simple arithmetic operations

all-India

age-group (years)	knowledge of simple arithmetic operations						
	can						
none	add only	add, subtract only	add, multiply only	add, subtract, only	add, multiply, only	add, subtract, multiply, divide	
(1)	(2)	(3)	(4)	(5)	(6)	(7)	(8)
		rural male					
15 & above	195	96	181	74	35	413	1000
7 & above	199	99	180	79	39	397	1000
5 & above	226	102	176	76	38	375	1000
		rural female					
15 & above	416	152	169	42	20	189	1000
7 & above	395	146	168	50	25	205	1000
5 & above	411	145	164	48	24	195	1000
		urban male					
15 & above	70	34	85	63	29	712	1000
7 & above	74	42	98	70	36	674	1000
5 & above	92	49	103	69	36	645	1000
		urban female					
15 & above	194	79	121	52	27	517	1000

5 & above	193	85	132	59	34	488	1000

PART C

2.12 Reading habits of literates : Literacy enables persons to read and comprehend written material. Apart from the functional requirements, this enables a person to improve the knowledge and skill. Further for persons who have achieved only the minimum literacy levels, the reading of books, newspapers etc. can help to attain functional literacy and retain the literacy status. Therefore, each literate member was further asked if he usually read newspapers/magazines/books. Reading of books other than those relating to one's own education/profession/occupation/religion only were considered. Usually reading implied only a regularity in the habit and did not imply 'everyday habit'. The number of persons who usually read newspapers/magazines/books per 1000 literates are presented in table (2.12.1). While only the proportions for the age-group 15 years and above are presented in table(2.12.1), detailed estimates by age-group are given in the relevant appendix table. The results show an expected pattern between the rural and urban sector. While about 32 percent of the rural persons were reported as usually reading newspapers the corresponding proportion was about 59 percent in urban sector. It may be recalled that the literacy rates in the comparable age-group has been estimated as around 40 and 62 per cent in the respective sectors.

Table (2.12.1) : Number of persons who usually read (i) Newspapers (ii) Magazines and (iii) Books per 1000 literates of age 15 years and above

usually read	all-India					
	rural			urban		
	male	female	person	male	female	person
(1)	(2)	(3)	(4)	(5)	(6)	(7)
Newspapers	358	229	315	643	505	588
Magazines	216	216	216	400	403	401
Books	193	168	185	262	265	263

The proportions of literates usually reading newspapers differed between males and females. But 22 per cent of the rural and 40 per cent of the urban literates; the percentages were identical for male and female in both the sectors. The gender difference in the number of persons usually reading books is also seen to be much less. Among the various age-groups the survey results show that percentage of persons reading newspapers and magazines was in the 25-34 years group in rural and urban sector. The highest percentage of these who usually read books was reported to be 25-34 years group in rural areas and 35-44 in urban areas.

2.12.1 Usage of library/Jana Shiksha Nilayam : The reading of books, newspapers etc. depends on factors like availability, affordability etc. besides the literacy status. Information was collected whether the household members were members or users of any library or atleast used the library facilities of the Jana Shiksha Nilayam. The number per 1000 literate persons of those who were members or users of any library is given in table(2.12.2).

Table(2.12.2) : Number of persons who are members/users of any library per 1000 literate persons of age 5 years and above

sector	male	female	all-India
			person
(1)	(2)	(3)	(4)
rural	40	24	34
urban	78	60	70

2.12.2 Table(2.12.3) the proportion of persons reading newspapers/magazines/ books and who are member/user of library are given for various states/uts. . The results are for literates in the 15 years and above age-group. Generally the pattern of variations recorded in the case of literacy rates are reflected in the numbers presented for states/uts. States/uts. with higher literacy rates have larger number of persons usually reading newspapers, magazines and books. Wide variations in these numbers are evident among the states/uts.

Table(2.12.3) : Number of persons who usually read newspapers/magazines/books and who are members/users of library per 1000 literates of age 15 years and above for states/uts.

state/ut.	usually read						members/users of library		rural
	newspapers		magazines		books

PART D

2.13 Literacy status of households : A household occupies an important position in the socio-economic context and is the ultimate unit for many research studies and Govt. welfare programs. Having a literate member in a household will qualitatively make the household different from households having none. Further a household with a literate female member is also considered quite important in the context of women's role in household decision making as in family planning, children's schooling etc. A special tabulation of the data was done to tabulate households having no literate member and households having no literate female member. Three age-groups were considered viz. 5 years and above, 7 years and above, 15 years and above. In tables 2.13a & 2.13b, households without any literate member and households without any female member respectively are considered. For arriving at these results the numerator consisted of all households without any literate member(female member) and the denominator consisted of all households. Thus the numerator consisted of households which did not have any member in the specified age-groups also. Obviously this does not make much difference in the case of persons. But when attempt is being made to estimate households without any literate female member, it is necessary to consider whether households had any female member in the specified age-group. This is evident from tables 2.13c & 2.13d where only the households which had atleast one member(female member) in the age-group under consideration were taken into account. A difference is seen in both the number of households and the average number of persons in the households.

Table (2.13a) : Number of households without any literate member in specified age-groups per 1000 households

age-group (years)	households without literate member		avg. no.of persons per household		all-india
	rural	urban	rural	urban	
	(1)	(2)	(3)	(4)	(5)
5 & above	324	116	4.3	4.1	
7 & above	331	118	4.1	3.9	
15 & above	424	162	3.1	3.1	

Table (2.13b) : Number of households without any literate female member in specified age-groups per 1000 households

age-group (years)	all-india			
	households without literate female member		avg. no.of females per household	
	rural	urban	rural	urban
(1)	(2)	(3)	(4)	(5)
5 & above	623	348	2.1	1.9
7 & above	633	354	2.0	1.8
15 & above	727	419	1.5	1.5

In the rural sector roughly 32 per cent of the households had no literate member. About 62 per cent have no female literate member. If literate children below 15 years are ignored these percentages rise to 42 and 73 in rural and urban sectors (ref.table 2.13a and table 2.13b). After these figures are adjusted as explained before the corresponding figures are about 32 and 61 per cent respectively in the 5 years and above age-group and for the 15 years and above age-group these are 42 and 71 per cent.

The adjusted rates, for the urban sector are comparatively lower than for the rural sector, are 12 and 23 per cent for the 5 years and above age-group, and 15 and 34 per cent for the 15 years and above age-group.

In tables 2.13.1a & 2.13.1b, the unadjusted results are presented for all the states/uts.. These exhibit variations similar to the inter state variations observed in the case of literacy rates.

Table (2.13c) : Number of households without any literate member in specified age-groups per 1000 households

age-group (years)	(adjusted rates) all-india			
	households without literate member		avg. no.of persons per household	
	rural	urban	rural	urban
(1)	(2)	(3)	(4)	(5)
5 & above	324	115	4.3	4.1
7 & above	330	117	4.1	3.9
15 & above	421	153	3.1	3.1

LIST OF TABLES

table no.	description	page no.
(1)	(2)	(3)
1.	Distribution of persons by age-group for each sex and sub-sample	A1 - A2
2.	Number of literate persons per 1000 persons by age-group and social group for each sex	A3 - A4
3.	Number of literate persons per 1000 persons by income class and social group for each sex	A5 - A6
4.	Number of literate persons per 1000 persons by land possessed class and social group for each sex (rural only)	A7
9.	Distribution of literates by general education for each age-group and sex	A8 - A13
10.	Number of literates who (i) lapsed into illiteracy, (ii) completed 4 years of formal schooling and (iii) attended AEC/NFSC per 1000 illiterates by age-group for each sex	A14 - A15
11.	Distribution of persons by knowledge of number system - counting of numbers for each age-group and sex	A16 - A21
12.	Distribution of persons by knowledge of number system - reading of numbers for each age-group and sex	A22 - A27
13.	Distribution of persons by knowledge of number system - writing of numbers for each age-group and sex	A28 - A33
14.	Distribution of persons by knowledge of number system - simple arithmetic operations for each age-group and sex	A34 - A39
15.	Number of persons who usually read (i) News-paper, (ii) magazines, (iii) books and (iv) who are members of any library per 1000 literates for each age-group and sex	A40 - A41

Note : The marginal aggregates of estimated persons in the table may be used only for combining ratios. Estimated number of persons under any particular classificatory characteristic may be obtained by applying estimated ratio on the Census population.

Appendix B

SAMPLE DESIGN AND ESTIMATION PROCEDURE

B.1 Introduction : A two stage stratified design is adopted for the survey. The first stage units (FSUs) are villages in the rural sector and urban blocks in the urban sector. The second stage units are households in both the sectors.

B.2 Sampling Frame for FSUs : The list of 1981 census villages constitute the sampling frame for rural sector in most of the districts. However, in some areas where either the 1981 census was not undertaken or the available list was incomplete, the list of 1971 census villages were used. For the urban sector, the lists of NSS Urban Frame Survey(UFS) blocks served as the sampling frame.

B.3 Stratification : States are first divided into agro-economic regions by grouping contiguous districts which are similar in respect of population density and crop pattern. In Gujarat, however, some districts have been split for the purpose of region formation in consideration of the allocation of dry areas and the distribution of tribal population in the state.

B.4 In the rural sector, within each region, each district with 1981 census rural population less than 1.8 million formed separate stratum. Districts with larger population are divided into two or more strata, depending on population, by grouping contiguous tehsils similar, as far as possible, in respect of rural population density and crop pattern. In Gujarat, however, in case of districts extending over more than one region, even if the rural population was less than 1.8 million, the portion of a district falling in each region constituted a separate stratum.

B.5 In the urban sector, strata are formed again within the NSS region on the basis of the population size classes of towns. Such city with population 10 lakhs or more formed separate stratum. Further within each region, the different towns are grouped to form three different strata on the basis of the population according to the 1981 census (less than 50,000; 50,000 - 199,999 and 200,000 - 999,999).

B.6 The total all-India sample of FSUs determined on the basis of the investigator-strength in different states/u.ts and the approximate workload within each village/block has been allocated to different states/union territories in proportion of the strength of the central field staff in the respective states/u.t. The state/u.t. sample size thus obtained is allocated again to the rural and urban sectors considering the relative sizes of the rural and urban population with almost double weightage for the urban sector. Within each sector of a state/u.t., the respective sample size is re-allocated to the different strata in proportion to the stratum population. Allocation has been adjusted such that the sample size for a stratum is atleast 4 or a multiple of 4 for the rural and urban sectors separately.

B.7 Selection of FSUs : The sample villages have been selected circular systematically with probability proportional to population in the form of two independent sub-samples. The sample blocks have been selected circular systematically with equal probability also in the form of two independent sub-samples.

B.8 Selection of hamlet-groups/sub-block Large villages and blocks have been divided into a suitable number of hamlet-groups and sub-blocks respectively having equal population content. Two hamlet-groups have been selected from large villages, whereas, only one sub-block is selected from large blocks.

B.9 Selection of households From each FSU, a total of 18 households in general, have been surveyed for Disability and Literacy & Culture after arranging the households of a FSU in a specified manner. In a FSU, all the households having at least one physically disabled person have been identified. If the number of such households is 10 or less, all those households have been selected for Disability survey. If the number of such households is more than 10, then a maximum of 14 households have been selected for Disability survey. After deciding the number of households to be selected for Disability survey, the balance over 18 have been selected circular systematically with equal probability for the survey of Literacy & Culture after arranging all the households according to the highest educational level among earners of the households. The number of households to be selected for Literacy & Culture have been so adjusted as to make it always a multiple of two.

B.10 For the survey on Developmental milestone of children, all the households selected for the survey on Disability and one-half of the households selected for the survey on Literacy & Culture have been considered. The test for literacy have been conducted on other half of the households selected for the survey on Literacy & Culture.

B.11 Survey period and Sub-round : The field work of the survey started in July 1991 and was completed in December 1991. The survey period of six months has been divided into two sub-rounds of three month's duration each. While period of survey for sub-round-1 was July-September 1991, that for sub-round -2 was October-December 1991. Equal number of sample villages and blocks were allotted for the survey in each of these two sub-rounds.

B.12 Estimation Procedure : The following notations are used in the estimation procedure

S = subscript for S-th state/u.t./region;

s = " s-th stratum;

i = " i-th sample village/block;

j = " j-th sample household;

t = " t-th sub-sample;

P = Total frame population of the stratum in rural sector;

p = population of sample village (used for selection);

N = Total number of urban blocks in frame in urban stratum or, in Arunachal Pradesh, total number of villages in frame in rural stratum :

n = number of sample villages/blocks available for tabulation including depopulated and other zero cases in rural/urban stratum (excluding casualty and other not received cases);

D = number of hamlet-groups/sub-blocks formed ;

$D^* = 1$, if $D = 1$ and

= $D/2$, if $D > 1$;

c = number of census villages in surveyed revenue village;

H = total number of households listed in a village/block;

H = total number of households with atleast one disabled
1 member, listed in a village/block;

h = number of sample households available for tabulation;

h = number of sample households with at least one disabled
1 member available for tabulation;

h = number of sample households available for tabulation which
3 were selected for schedule 30 and belonged to the
disability stratum * but not selected for schedule 26;

h = number of sample households available for tabulation which
4 were selected for schedule 30 and did not belong to the
disability stratum*;

x, y = values of any character;

X or Y = aggregate of x or y ;

R = any ratio of the form Y/X ;

A cap (^) placed over any symbol such as \hat{Y} denotes the estimates obtained from the sample.

B.13 ESTIMATES OF AGGREGATES : RURAL: The formula for \hat{Y} , the estimate of aggregate of any characteristic y , are given below for each schedule :

B.13.1 Schedule 26 : For states and u.t.'s,

$$\hat{Y} = \sum_{s=1}^S \frac{P_s}{s} \frac{n_s}{n} \frac{D^*_s}{c} \frac{H_{si}}{p_h} \frac{h_{lai}}{s_{si} l_{si}} \sum_{j=1}^{l_{si}} y_{sij} \quad \dots \dots \dots \quad (1)$$

B.13.2 schedules 30 : For states and u.t.'s

$$\hat{Y} = \sum_{s=1}^S \frac{P_s}{s} \frac{n_s}{n} \frac{D^*_s}{c} \frac{H_{si}}{p_h} \frac{h_{si}}{s_{si} s_{si}} \sum_{j=1}^{s_{si}} y_{sij} \quad \dots \dots \dots \quad (2)$$

* All the listed household of a fsu with at least one disabled member is considered to form a notional 'disability stratum'

B.13.3 Schedule 26.1: For states and u.t.'s,

$$\hat{Y}_s = \sum_s \frac{P}{s} \sum_n \frac{n}{s} \frac{D}{c} \frac{s_i}{s_i} \left[\frac{H}{h} \frac{1si}{1si} - \frac{H}{h+h} \frac{1si}{1si} \right] \sum_{j=1}^{\frac{h+h}{1si+3si}} y_{sij}$$

$$\frac{H}{h} \frac{1si}{1si} - \frac{H}{h+h} \frac{1si}{1si} \sum_{j=1}^{\frac{h}{4si}} y_{sij} \quad \dots(3)$$

B.14 ESTIMATES OF AGGREGATES: URBAN: The formula for \hat{Y} are given below for each schedule :

B.14.1 Schedule 26 : For all states and u.t.'s,

$$\hat{Y}_s = \sum_s \frac{N}{s} \sum_n \frac{h}{s} \frac{D}{s_i} \frac{H}{h} \frac{1si}{1si} \sum_{j=1}^{\frac{h}{1si}} y_{sij} \quad \dots(4)$$

B.14.2 Schedule 30 : For all states and u.t.'s,

$$\hat{Y}_s = \sum_s \frac{N}{s} \sum_n \frac{h}{s} \frac{D}{s_i} \frac{H}{h} \frac{1si}{1si} \sum_{j=1}^{\frac{h}{1si}} y_{sij} \quad \dots(5)$$

B.14.3 Schedule 26.1: For states and u.t.'s,

$$\hat{Y}_s = \sum_s \frac{N}{s} \sum_n \frac{h}{s} \frac{D}{s_i} \left[\frac{H}{h} \frac{1si}{1si} - \frac{H}{h+h} \frac{1si}{1si} \right] \sum_{j=1}^{\frac{h+h}{1si+3si}} y_{sij} +$$

$$\frac{H}{h} \frac{1si}{1si} - \frac{H}{h+h} \frac{1si}{1si} \sum_{j=1}^{\frac{h}{4si}} y_{sij} \quad \dots(6)$$

B.15 ESTIMATES OF RATIOS : The estimate of the ratio of the form

$R = \hat{Y}/\hat{X}$ is given by

$$R = \frac{\hat{Y}}{\hat{X}} \quad \dots\dots\dots (7)$$

where \hat{Y} and \hat{X} are obtained by using the formulae already given at the level at which R is required.
